Wes Mantooth Investigation

This week is the mid-term exam and I am investigating the computer of Wes Mantooth. The evidence is a forensic image named Mantooth.E01, which I am examining in Forensic Explorer and Magnet AXIOM. The image is from a Windows system named WESMANTOOTH-PC that was installed on February 27, 2007, and is registered to Wes Mantooth of Volturi Enterprises. The system has five user accounts (Administrator, Guest, Wes Mantooth, Dracula, and Laurent), so I need to determine who used this computer. To do this, I will analyze the registry, USB device history, recent documents, email clients, uninstalled programs, web history, pictures, and documents. Mantooth is suspected of credit card skimming fraud and of possessing or attempting to manufacture illegal drugs, and I need to determine whether the evidence on this computer supports those allegations.

Imaging the Hard Drive

FTK Imager

The image of this computer was already captured and was given to me as the file Mantooth.E01, so I did not pull the hard drive or use a write blocker myself. According to the image information in Forensic Explorer, the image was created with AccessData FTK Imager version 2.5.3.14 on a Windows XP machine. The acquired date and the system date are both 7/2/2008 9:09:34 PM (UTC). Figure 1.0 shows the image properties.

Figure 1.0

The image is an Encase (E01) disk image with 250,879 sectors at 512 bytes per sector. This makes the device size 122.5 MB (128,450,048 bytes). It was saved using the fast compression setting.

When you take an image of a drive you want to look at the hash values. This is a digital finger print of the file. If the contents are changed in any way the hash will change too (Trend Micro, n.d.). Only the MD5 hash was stored when the image was acquired, because the SHA1, SHA256, and SHA512 acquisition values show Not present. Forensic Explorer verified the image, and the MD5 verification hash (31217210a1a69f272079a3bde3d9d8fc) matches the acquisition MD5 hash. Forensic Explorer also calculated the SHA1 hash (12e4ac047e328ca2bd63a4d65df25b3ecba55769) and the SHA256 hash (735ec4d84551ad31585ac346fc90a53d0730f8637e77c4cdc8ac9ff37c77ca7b). Figure 1.1 shows the evidence list with these values. Since the hash values match, I can proceed with the investigation.

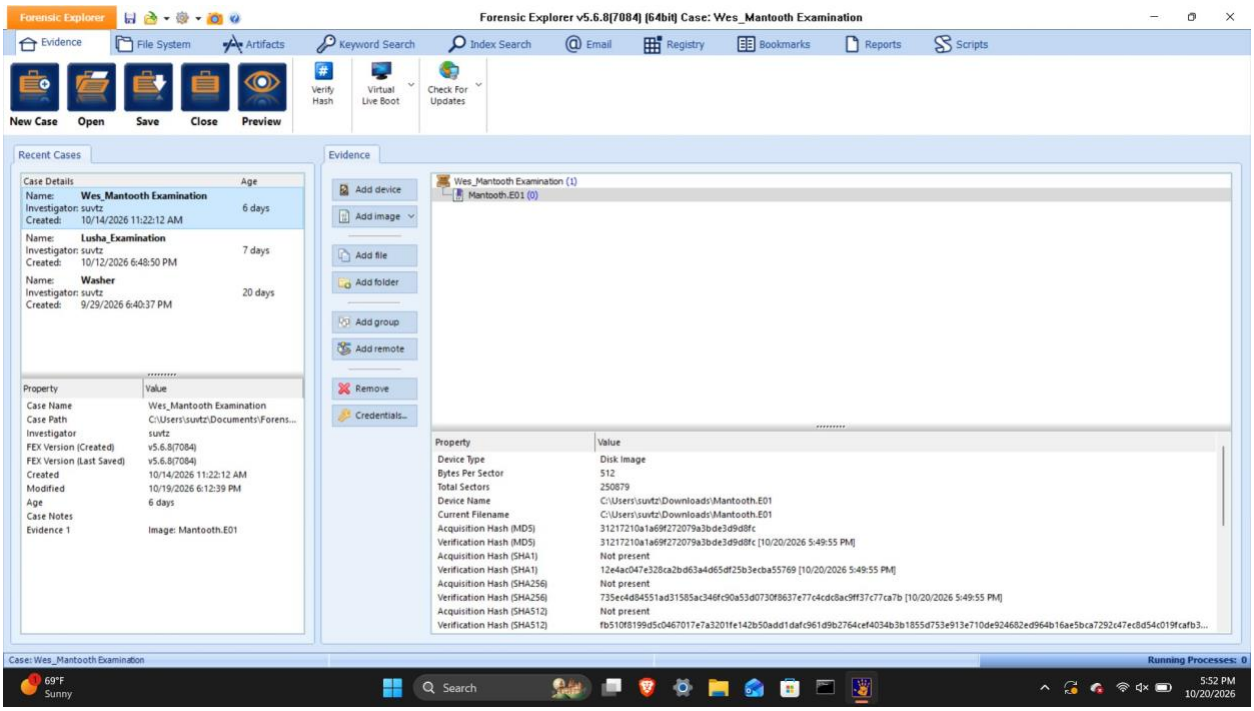

Figure 1.1

Presentation of Evidence

Forensic Explorer

The first software that I am going to use is called Forensic Explorer® V.5.6.8. This software will allow me to look at the image that was already taken of the drive without changing the original evidence. Before I can look at the image I need to create a new case. Figure 1.2 shows the capture of the case name, time zone, and investigator information. The case was created on 10/19/2026 at 6:21:44 PM, the case number is Mid-Term Final, and the investigator is suvtz. The cases folder is where Forensic Explorer saves everything for this case, and the time zone is set to Local Time, which is Eastern Standard Time. This matters because the time zone setting changes how the dates and times in the case are displayed, so I need to know what it is set to when I read the timestamps later.

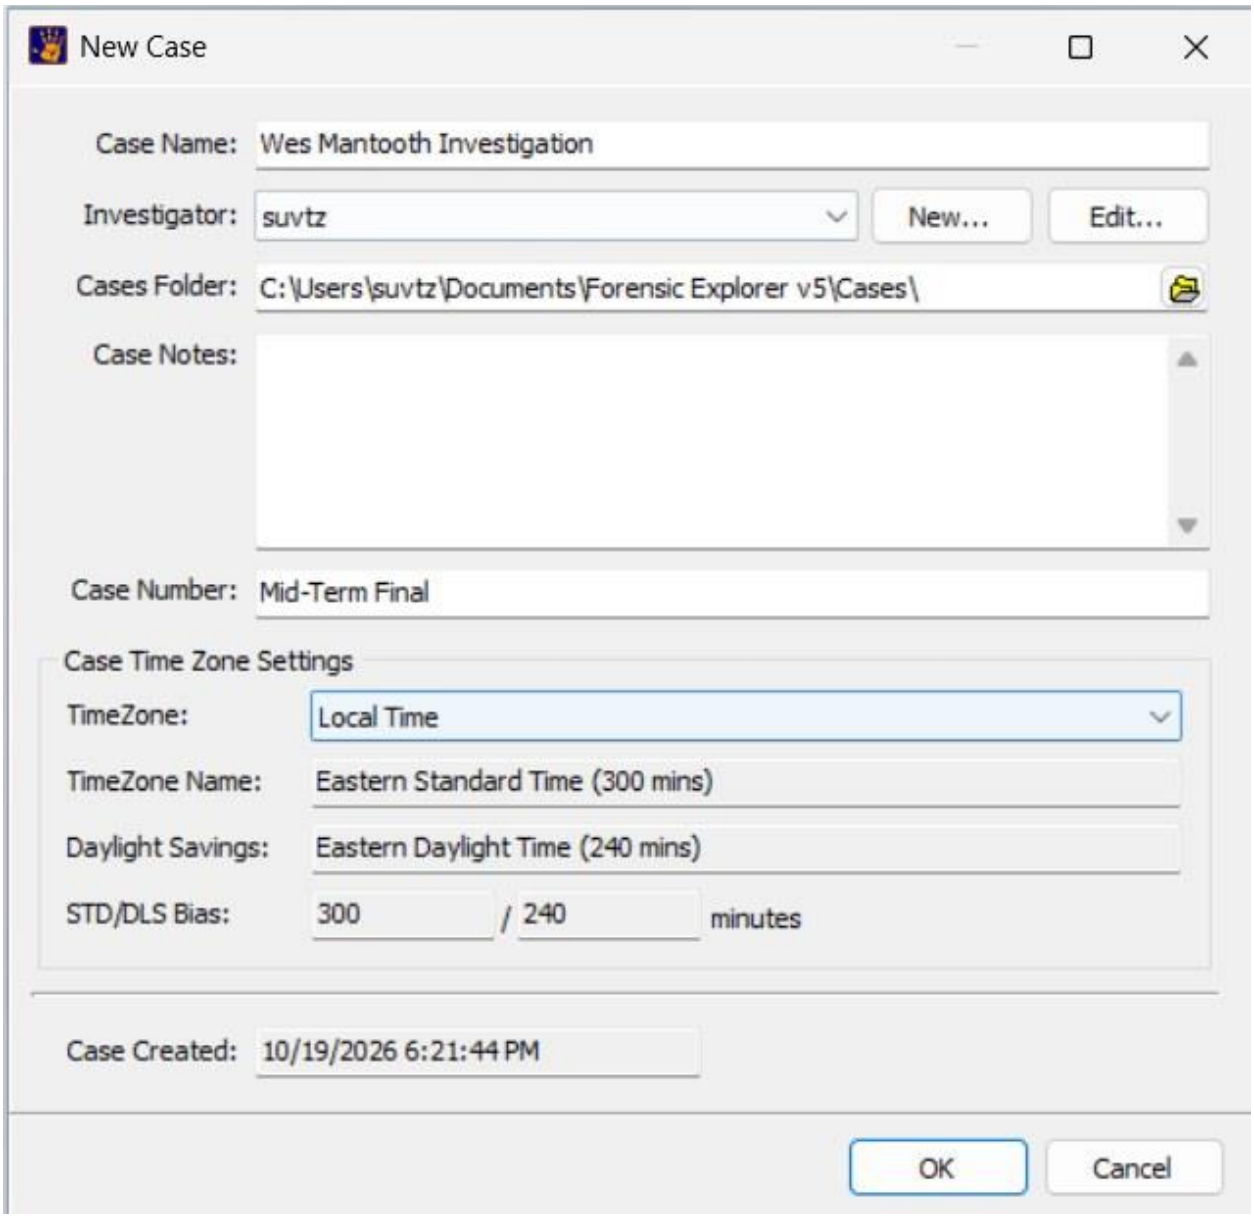

Figure 1.2

Once the case has been created it is saved as a .FEX case file in the Cases folder. Figure 1.3 shows opening the case file by browsing to the case folder. Figure 1.4 shows what is inside of the case folder: AttachedEvidence, DTSearchIndexes, Exported, Logs, Reports, VirtualFS, and the case file Wes_Mantooth Examination.FEX.

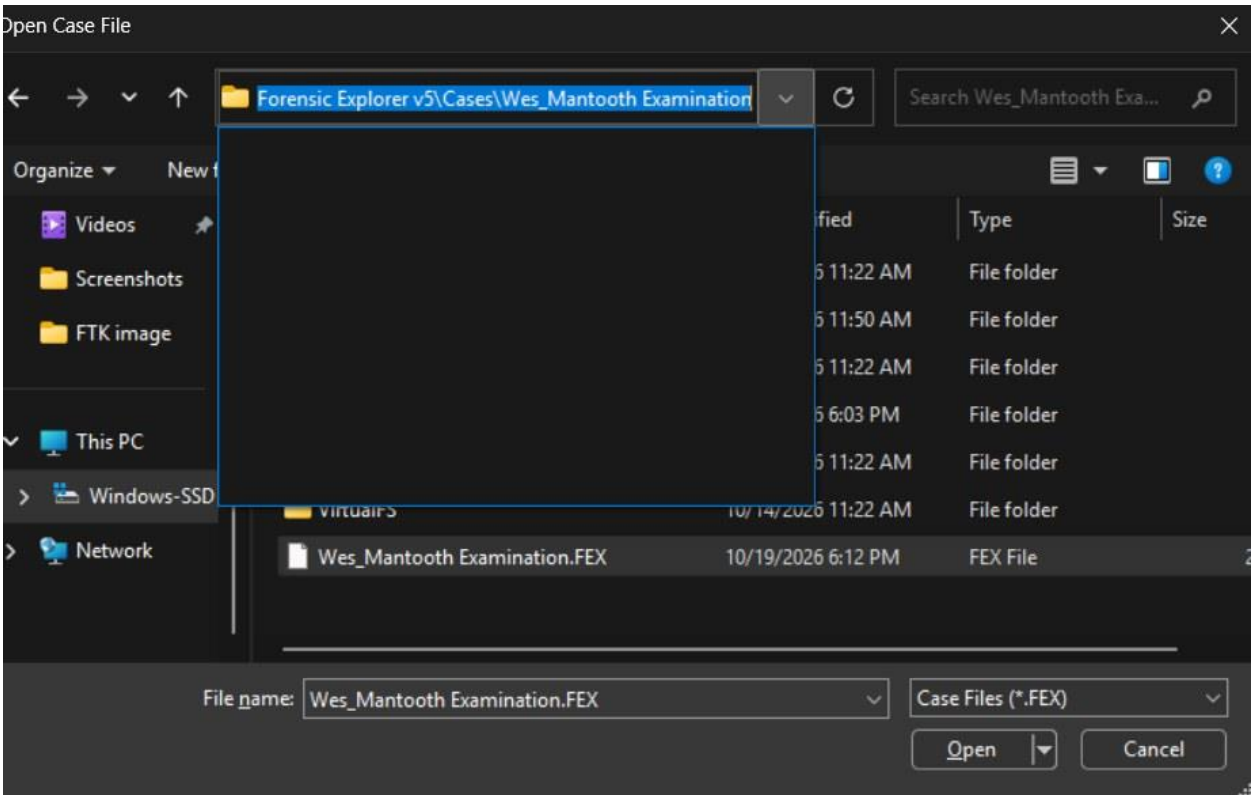

Figure 1.3

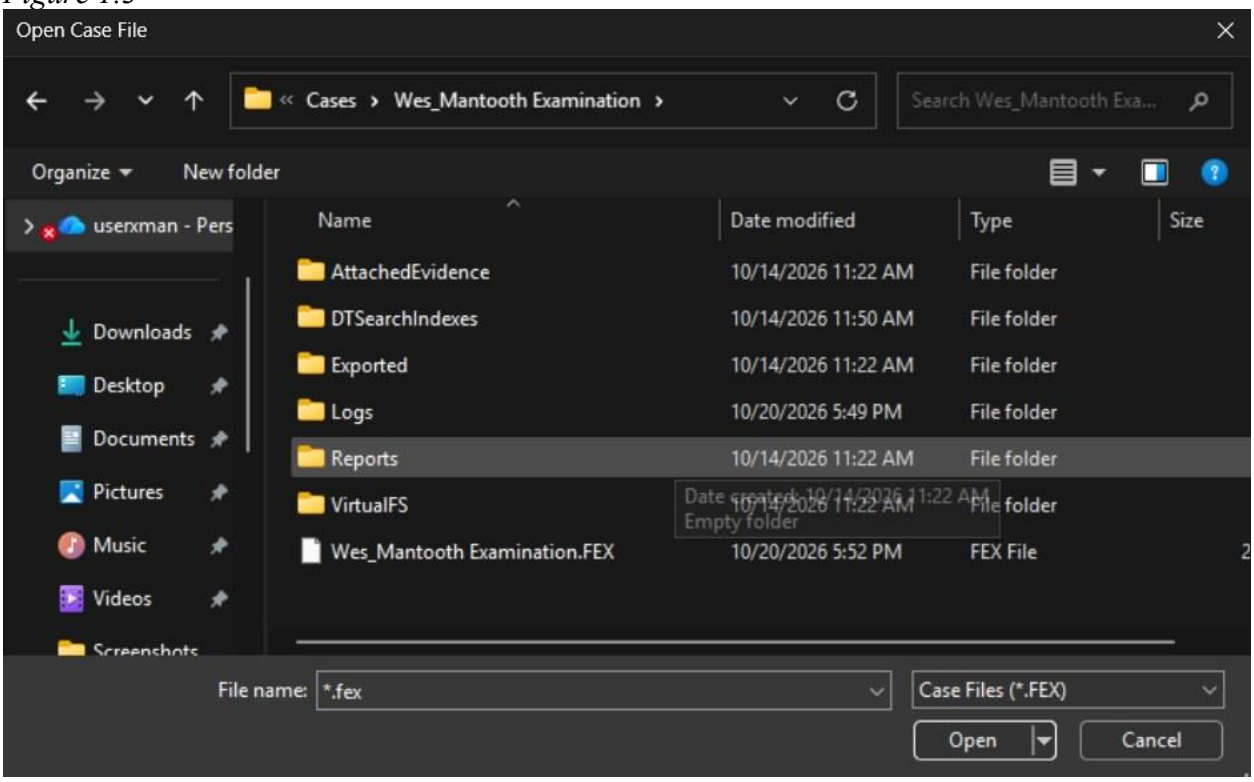

Figure 1.4

Next I need to add the image to Forensic Explorer. I do this by clicking on the add image button and browsing to the file path. Figure 1.5 shows the image file Mantooth.E01 added to the evidence list.

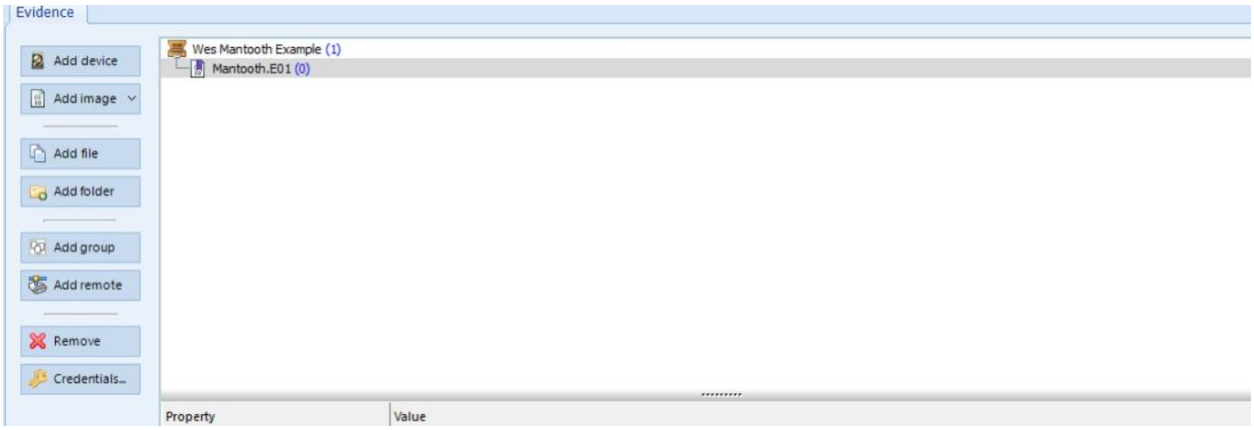

Figure 1.5

Now that the image has been added I need to go through the Evidence Processor and set the criteria that I am looking for. Figure 1.6 shows what selections I have chosen. Process in Parallel, Search for MBRs, Search for FileSystems, and Signature Analysis are checked. The device time zone is set to UTC (+00:00), which matches the time zone that AXIOM shows later in the report.

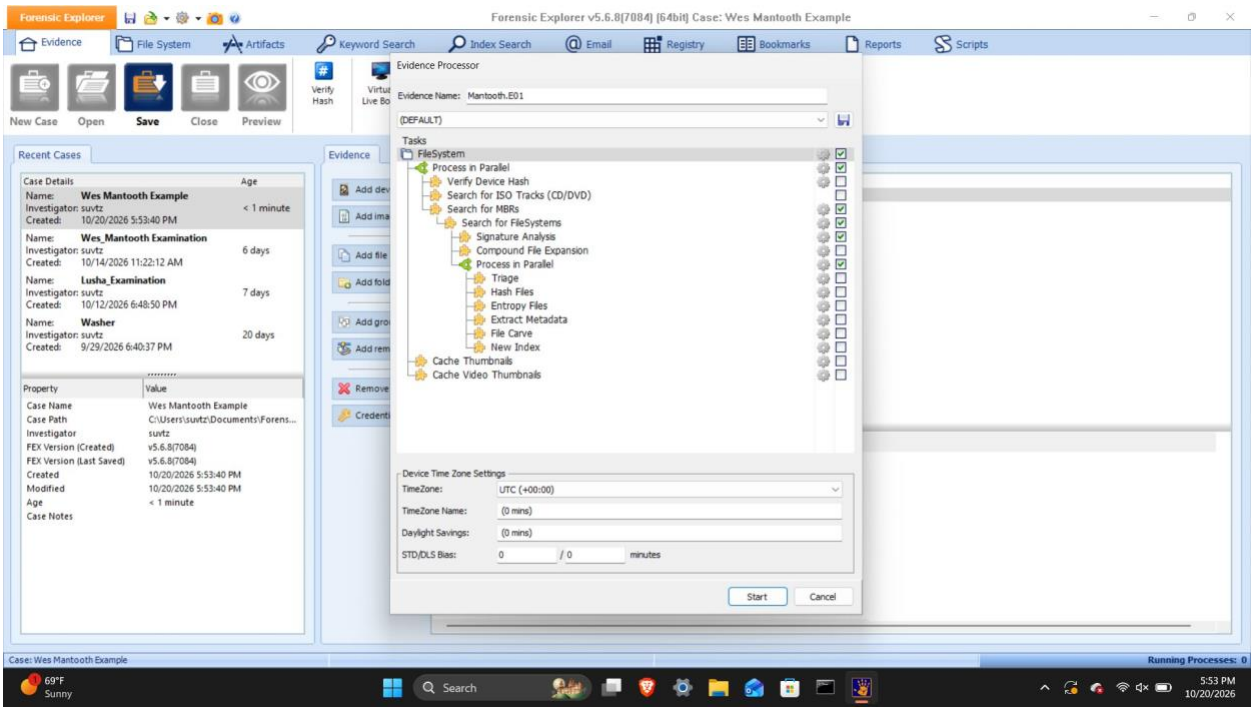

Figure 1.6

Registry

The registry is only found on Windows operating systems. The hives I am going to look at are: Security Account Manager, System, Software, NTUser.Dat. In order to view what is in the registry of the computer I need to send it to the registry module in Forensic Explorer. Figure 1.7 shows where the registry files are located (Windows\System32\config) and the SAM, SECURITY, SOFTWARE, and SYSTEM files being sent to the Registry module. The NTUSER.DAT file is in the Users\Wes Mantooth folder.

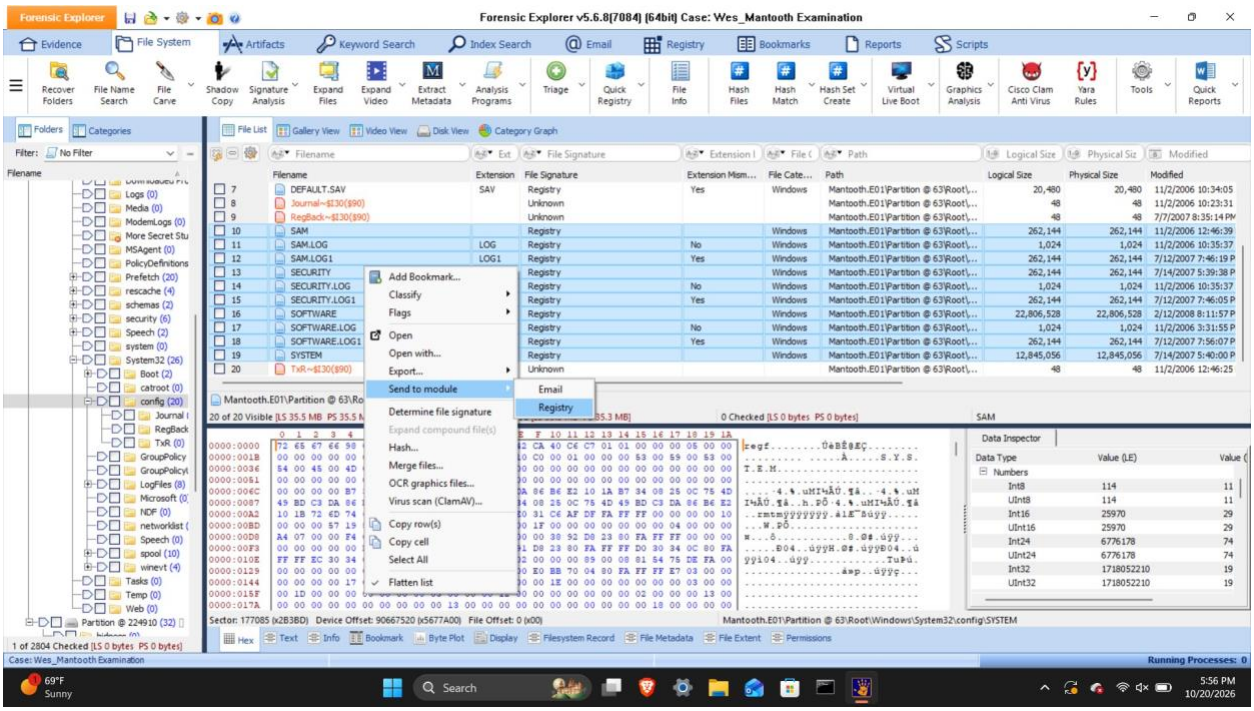

Figure 1.7

SAM.

The first hive for the registry is called Security Accounts Manager (SAM). This contains the user names and password information for the accounts. This machine has five accounts set up on it. Pasted below is the SAM information for all users.

Parse: \SAM\Domains\Account\Users

Wes Mantooth is the main user of this computer. His account (User ID 1000) was created on 27-Feb-2007, has 96 logins, and the last login was on 12-Feb-2008 at 19:12:08 UTC. The account has a password hint of "in your face" and 3 invalid password attempts. The Dracula account (full name Count Dracula, comment "The Tooth Account") only has 3 logins and the last login was 02-Apr-2007. That is before the web activity I found later, which happened on 7/12/2007 and 8/5/2007. The Laurent account was created on 12-Feb-2008, has never been logged into, and does not require a password. Administrator and Guest are the built-in accounts and both are disabled.

This is important because the web history, pictures, and documents that I found are stored under the Wes Mantooth user profile, and the only other account that was ever used stopped logging in before that activity took place.

System.

The second hive that I am going to look at in the registry is called System. This will tell me information on the system. Listed below are the computer name of the system and the USB devices that have been connected.

Computer name.

The computer name is WESMANTOOTH-PC and it is the same in both control sets. Since the name is based on the owner's name, it was most likely chosen when the computer was set up instead of being a random name that Windows made.
~~~~~~~~~~~~~~~~

Search for: SYSTEM\ControlSet###\Control\ComputerName\ComputerName\

The devices include an Apple iPod (drive G), a Sony DSC digital camera (drive H), several flash drives (including a UT_USB20 flash drive on drive F and a SanDisk Cruzer Mini on drive E), two Maxtor external hard drives, and several TREK ThumbDrives. Wes Mantooth is listed as the last user for most of the devices. The iPod was last connected on 12-Feb-2008 at 17:21:52 UTC. This is important because the Recent Docs show files and folders opened from Removable Disk (E:) and Removable Disk (F:), so some evidence may be stored on devices that were not part of this image.

Software.

The next hive in the registry is called Software. I will be looking at the email clients, the OS install date, the registered user, and what is installed on the computer.

Email Clients.

The email clients key lists five mail programs: AOL, Hotmail, Microsoft Outlook, Windows Mail, and Yahoo! Mail. These are the mail programs registered with Windows. This does not prove which one was used, so I will look at the email artifacts in AXIOM later.

Registry Key Processor finished.

OS Install Date.

Next, I am going to look at the Operating System install date (OS Install Date), which is February 27th 2007 at 7:22:03 PM. This is the same day that the accounts on the computer were created, so I should not expect any user activity from before this date.

Search for: SOFTWARE\Microsoft\Windows NT\CurrentVersion\InstallDate
Description: Installation date of the Operating System.
Reference: None.

Registered user.

The registered owner is Wes Mantooth and the registered organization is Volturi Enterprises. These values are entered when Windows is installed and they can be changed, so on their own they do not prove who used the computer. They do match the user account that has 96 logins.

Registry Key Processor finished.

There are 26 different programs in the list. Some of them stand out for this case. BestCrypt 8.0 and TrueCrypt are encryption programs, FileZilla is an FTP program, VNC Free Edition is a remote desktop program, and P2P Networking and WinRAR are also installed. The computer has several chat programs (AIM 6, Trillian, Yahoo! Messenger, and Windows Live Messenger) and the Mozilla Firefox browser. AccessData FTK Imager, Registry Viewer, and DNA are forensic tools, which shows the user had some forensic software on the machine.

NTuser.Dat

Recent docs.

The last hive is the NTUSER.DAT file for the user Wes Mantooth. The Recent Docs key lists the files and folders that the user opened. Pasted below are the recent documents.

Search for:
NTUSER\Software\Microsoft\Windows\CurrentVersion\Explorer\RecentDocs

Description: Recent documents as listed in the Windows "My Recent Documents" menu. Further information about the relative order of the listed files can be extracted from the "MRUListEx" value.
Reference: None.

Registry Key Processor finished.
```

The Recent Docs list has several items that matter to this case. There are files named ATM_THEFTS1.ppt, CC Nums.xls, Those who owes.xls, and C money plates.doc. There are folders named Checks, Car Titles, Business Ideas, Scripts, Secret Stuff, Super Secret Stuff, Tooth Docs, and EFS DOCS. The picture files include Prescription2.gif, prescription.gif, doc-prescription.jpg, C01VNCCHK_e.gif, and Z169PCHK_e.gif. The .bmp files untitled.bmp, Guts.bmp, and Camera.bmp match the E:\Business Ideas files that show up in the Internet Explorer history later in this report. There are also text files named like BitLocker keys and a prefetch file for BESTCRYPT.EXE, which tells me the encryption program was run.

I can only see that these files were opened. The list does not show what was inside of them, and the ones opened from the E: and F: removable disks are not part of this image.

Disk Structure

Size of Partition.

There is one image for this device. AXIOM found two partitions and some unpartitioned space on it (Figure 2.0). Partition 1 is 109.79 MB and Partition 2 is 7.84 MB. The whole image is 122.5 MB.

Format.

Partition 1 is formatted with NTFS and Partition 2 is an EXT-family file system (the type used by Linux).

Active File Review

Axiom

The next software that I will utilize is called Magnet AXIOM V.9.10.1.47349. Figures 1.8 – 2.0 below are how the case is loaded into the software. Figure 1.8 shows the case details, with the case number Wes_Mantooth and where the case files are saved. Figure 1.9 shows Mantooth.E01 being selected as the image. Figure 2.0 shows the evidence sources that AXIOM found on the image.

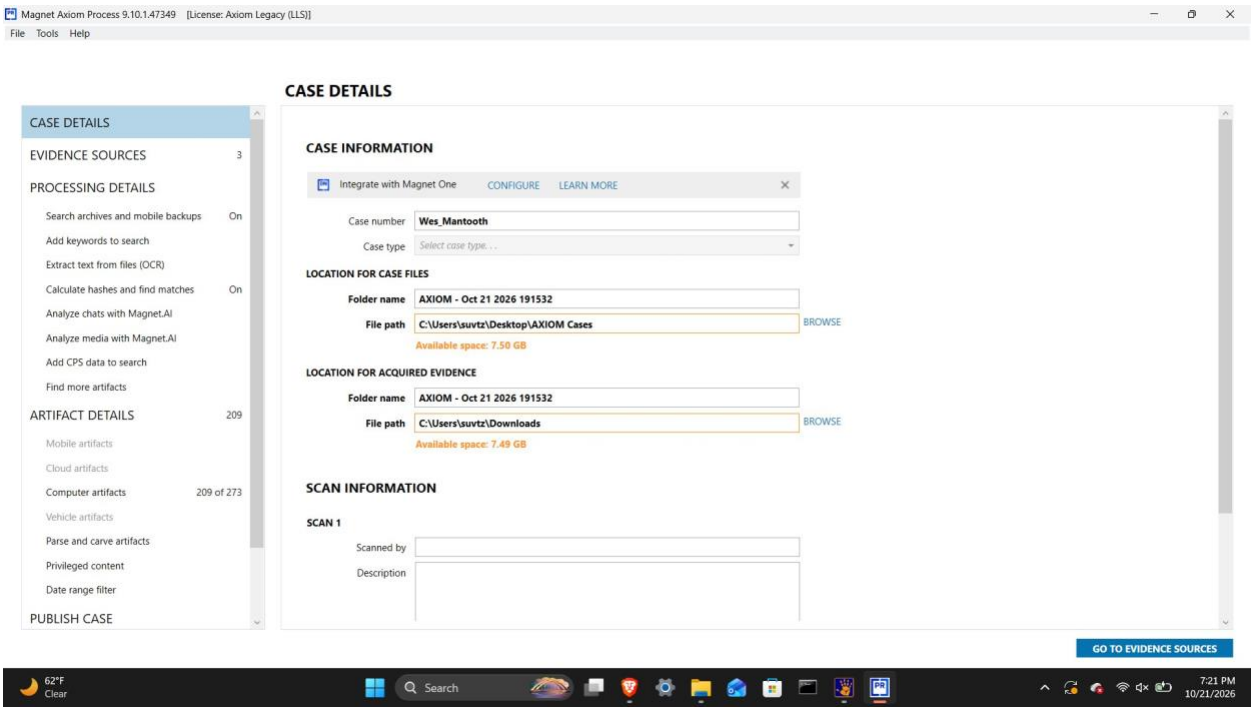

Figure 1.8

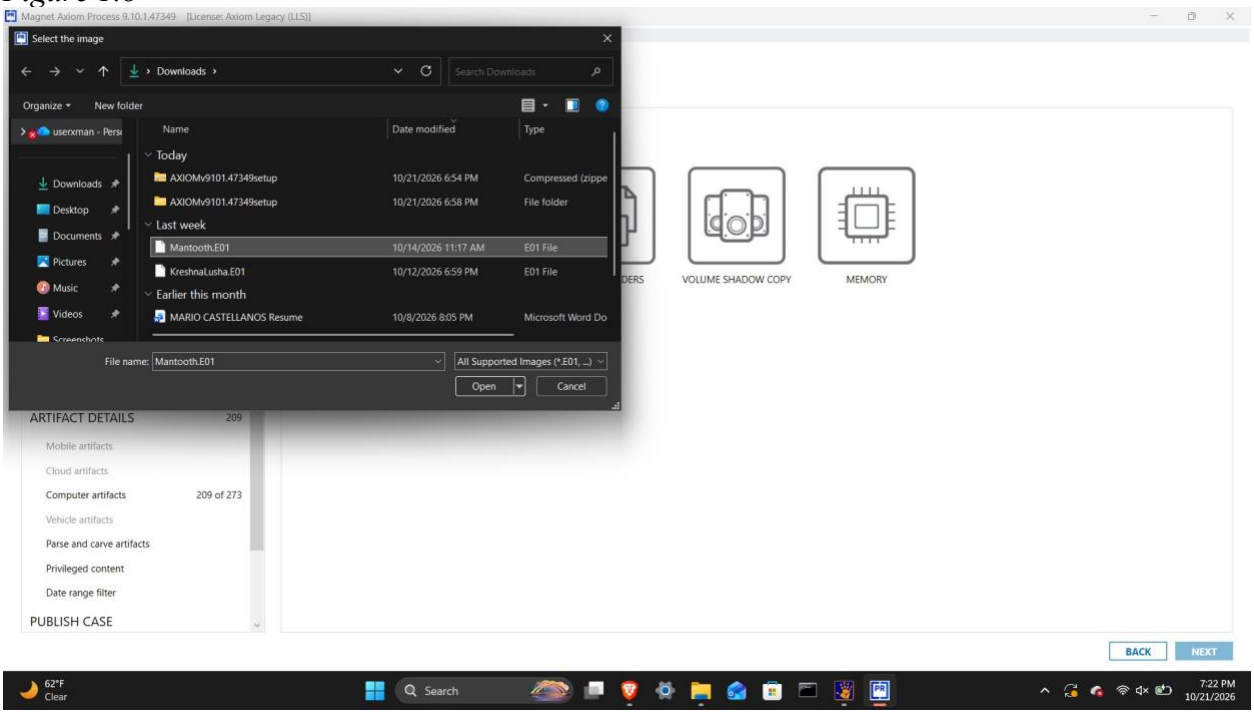

Figure 1.9

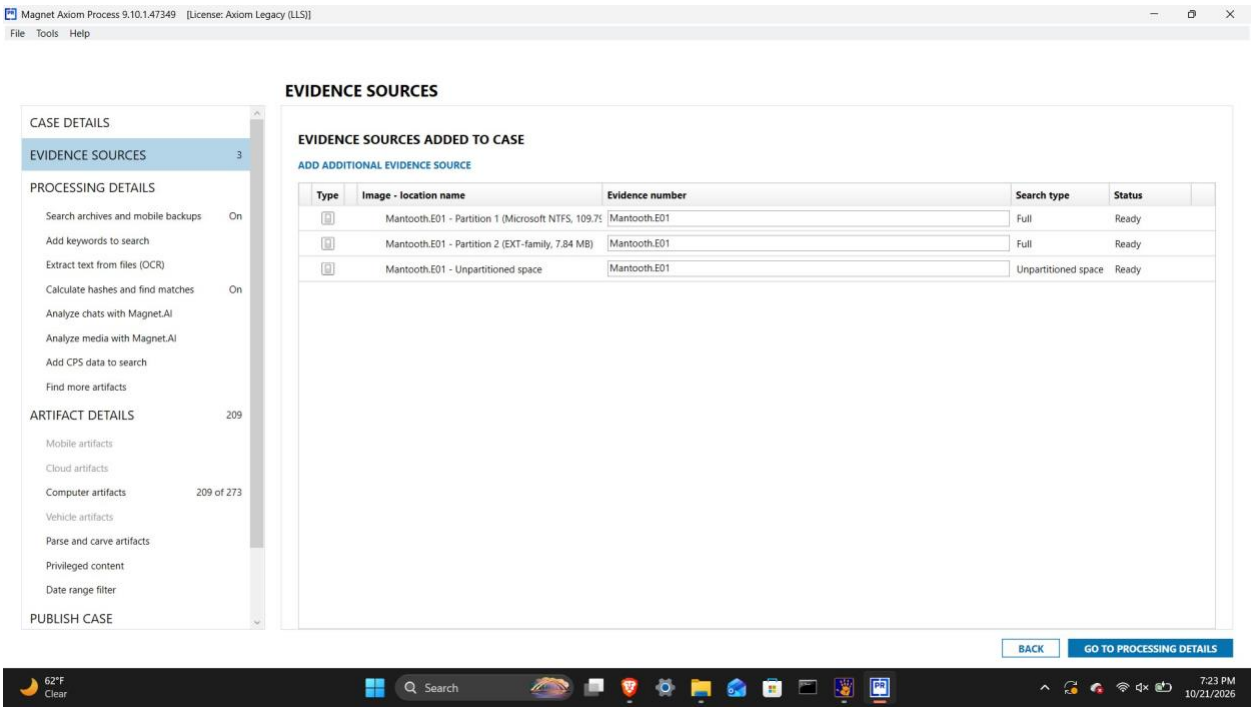

Figure 2.0

Once AXIOM finished processing, it sorted the evidence into categories. All of the times that AXIOM shows are in UTC. The categories that I am going to look at are Web Related, Media, Email & Calendar, and Documents.

Web Related.

AXIOM found 999 web related artifacts. This includes 195 Google searches, 121 Internet Explorer main history records, and 26 rebuilt webpages. All of the web artifacts I show below were found in the Internet Explorer history of the Wes Mantooth user, in the file Users\Wes Mantooth\AppData\Local\Microsoft\Windows\History\History.IE5\index.dat.

Google searches.

These are keywords that have been searched for on Google. The searches that stand out were made on 7/12/2007 between 11:15 PM and 11:17 PM: “atm card stealing,” “making meth,” and “check washing.” Check washing is a type of check fraud where the ink on a check is removed so the check can be written again. Figure 2.1 shows the web search for “atm card stealing” at 11:15:34 PM and Figure 2.2 shows the Google image search for the same words.

Figure 2.3 shows the search for “making meth” at 11:16:01 PM and Figure 2.4 shows the image search for “check washing” at 11:17:35 PM.

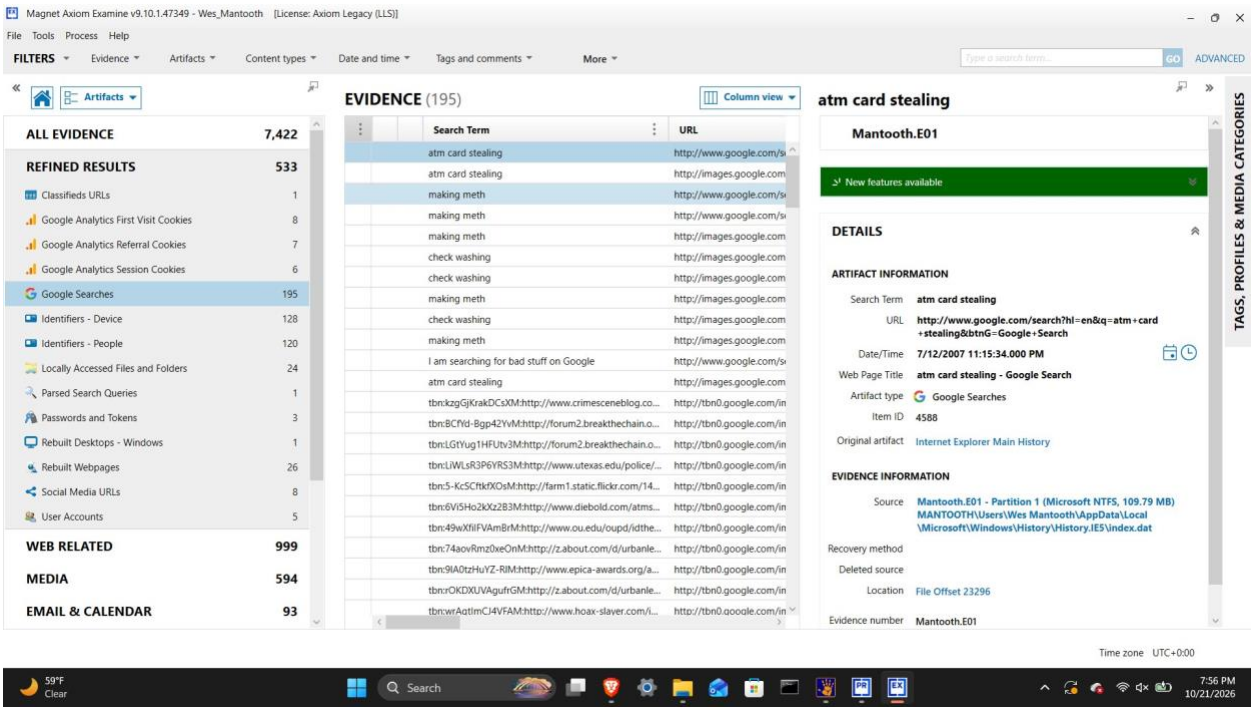

Figure 2.1

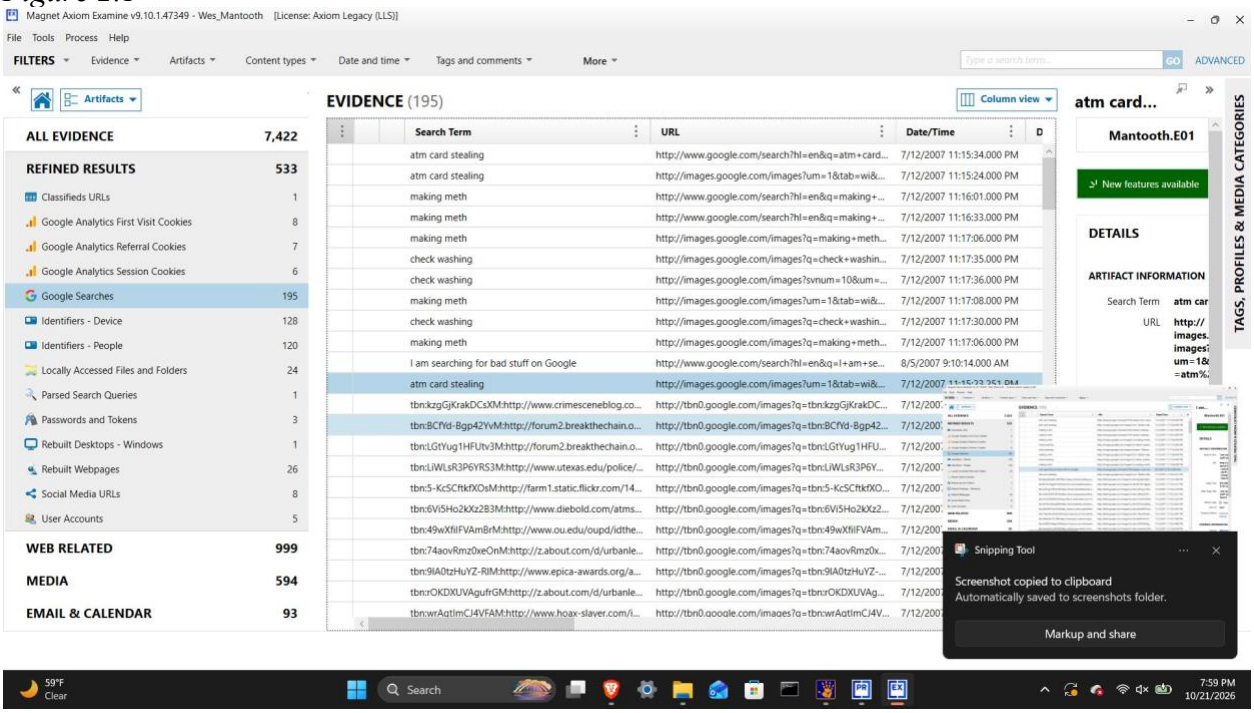

Figure 2.2

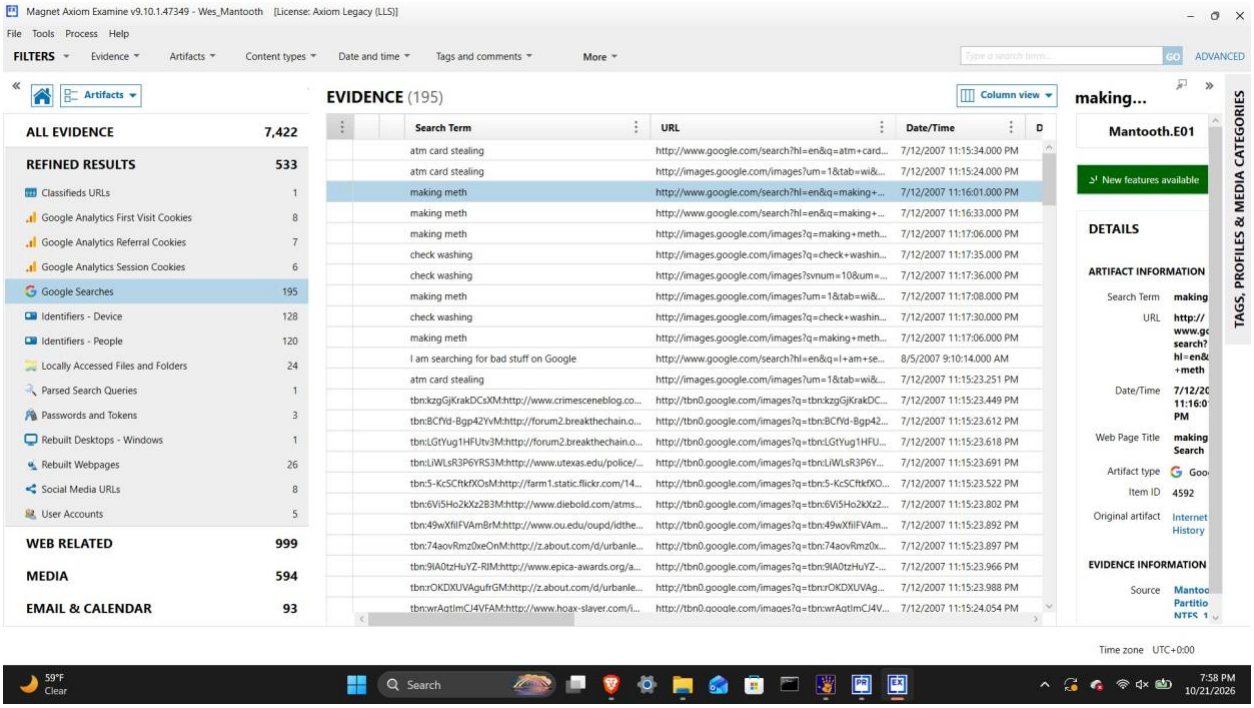

Figure 2.3

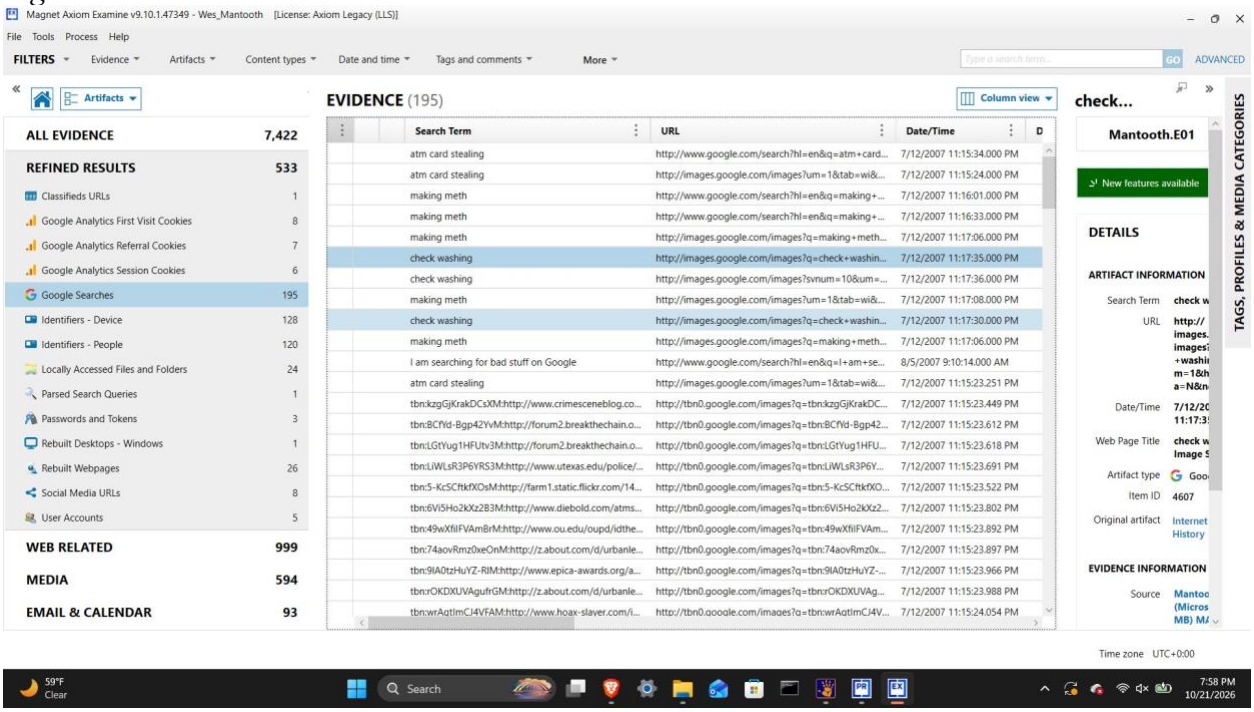

Figure 2.4

A month later he made another search, shown in Figure 2.5. On 8/5/2007 at 9:10:14 AM he searched Google for “I am searching for bad stuff on Google.”

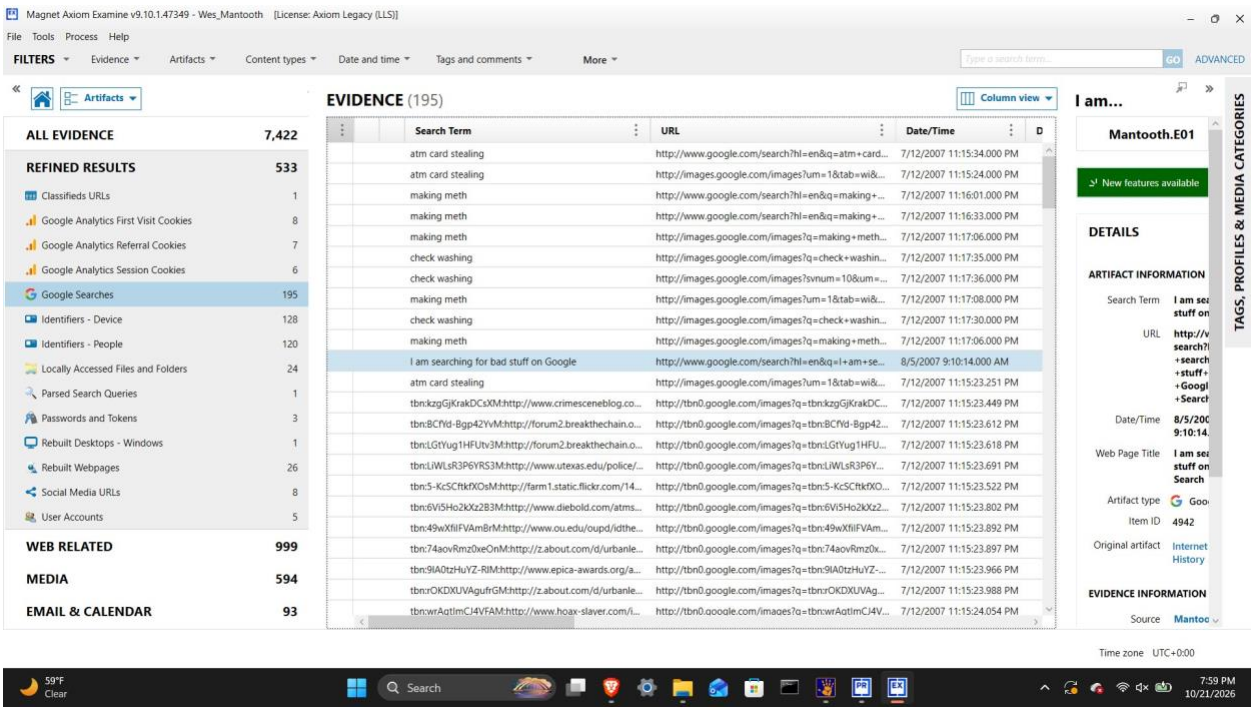

Figure 2.5

Internet Explorer web history.

AXIOM found 121 Internet Explorer main history records for Wes Mantooth. The history lines up with the searches. On 7/12/2007 (all times UTC) he visited the Snopes pages about an ATM camera at 11:13 PM (Figure 2.6 and Figure 2.7). Between 11:14 PM and 11:15 PM he opened the local files untitled.bmp, Guts.bmp, and Camera.bmp from E:\Business Ideas. At 11:15 PM he searched for "atm card stealing," at 11:15:52 PM he visited neonjoint.com's drug recipes page, at 11:16:01 PM he searched for "making meth," and at 11:16 PM he visited totse.com and physorg.com. At 11:17 PM he looked at a page on sccja.org with an image named csid_meth1.jpg and searched "check washing." Later that night he opened local files named ATM_THEFTS1.ppt on his Desktop (11:28 PM) and from E:\Business Ideas (11:29:42 PM, Figure 2.8), Ape_20sho… on his Desktop (11:31 PM), and Dear Sw… in his Documents folder (11:48 PM).

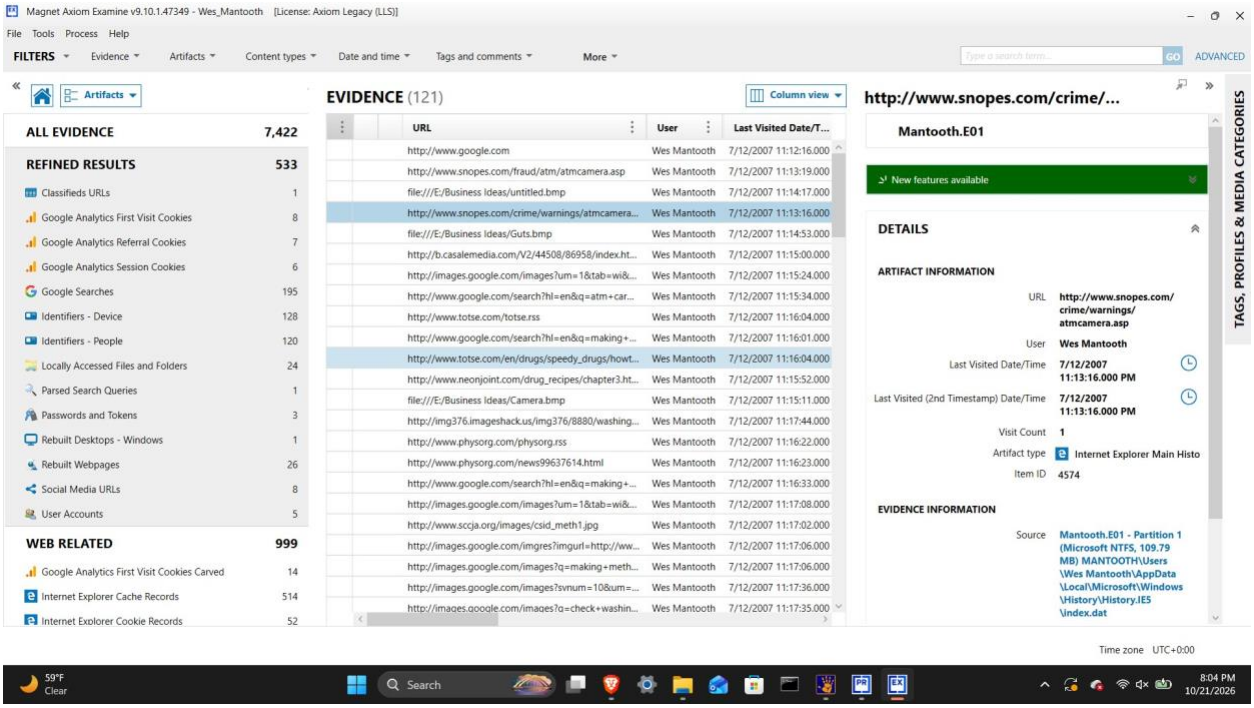

Figure 2.6

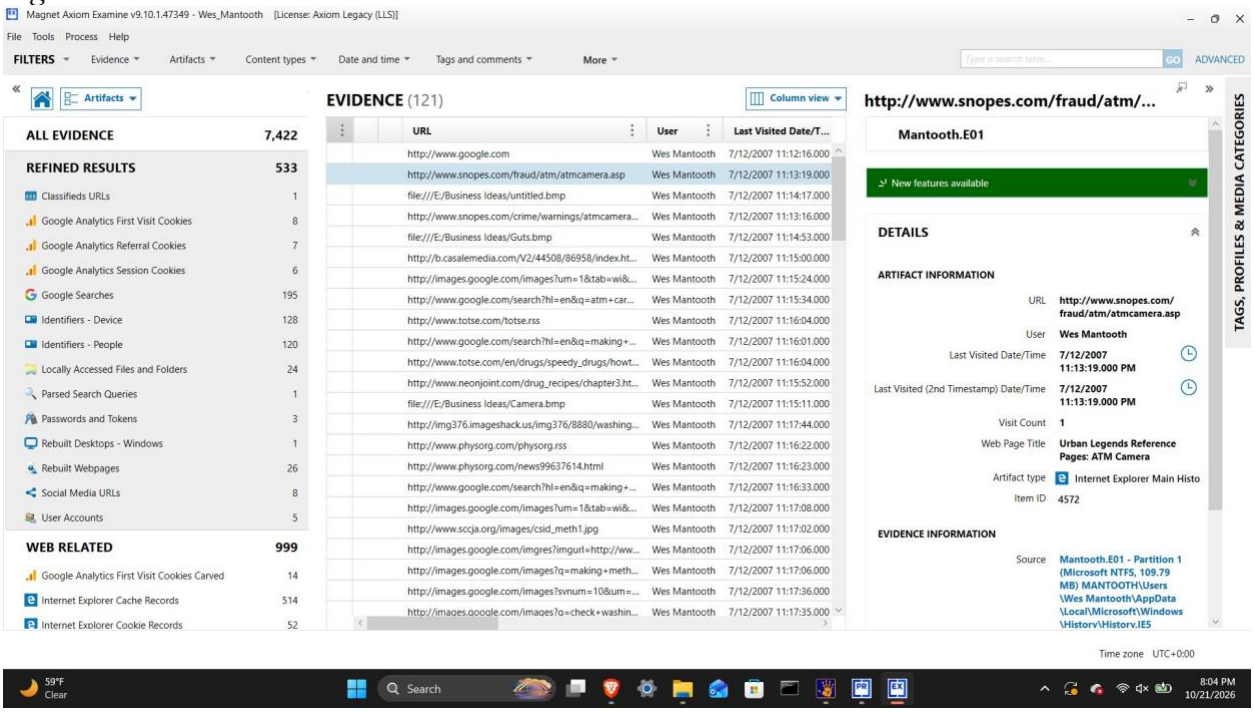

Figure 2.7

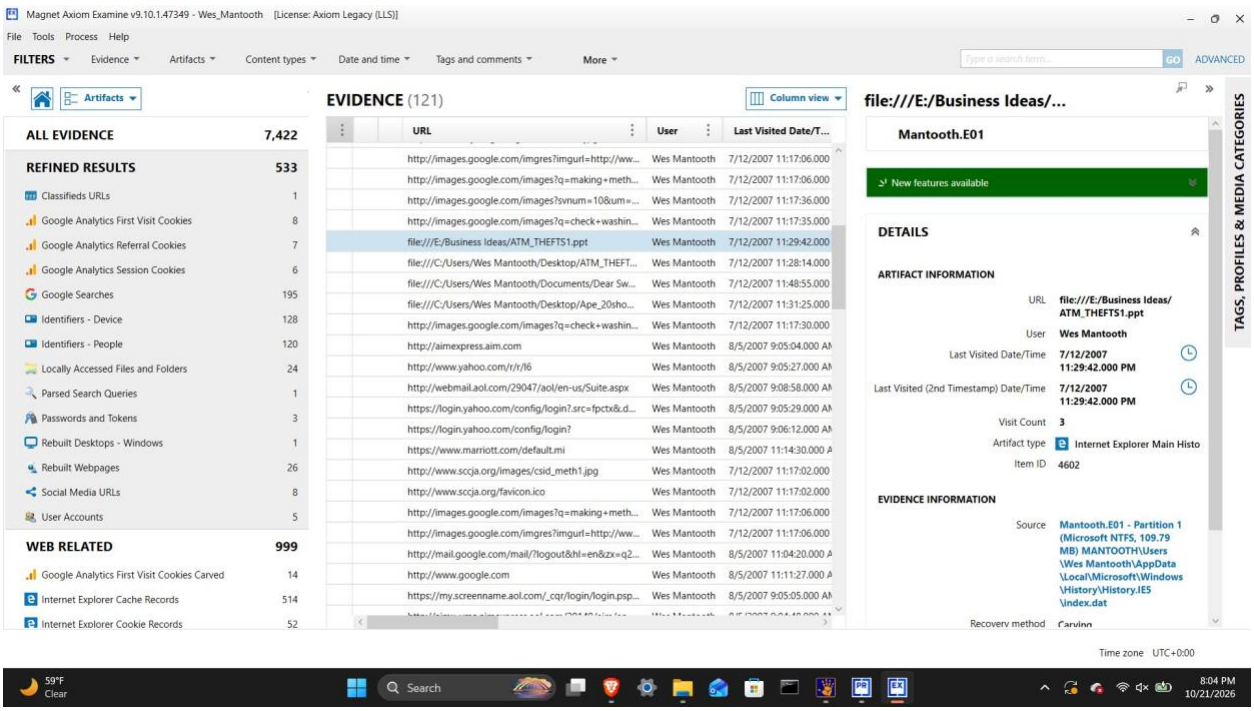

Figure 2.8

The E:\Business Ideas\ATM_THEFTS1.ppt entry was opened 3 times and AXIOM recovered it by carving. On 8/5/2007 between about 9:05 AM and 11:14 AM there is history for AIM Express, Yahoo login pages, AOL webmail, and a Gmail logout. He also searched for the phrase “I am searching for bad stuff” on Yahoo at 9:11:20 AM (Figure 2.9) and on other search engines.

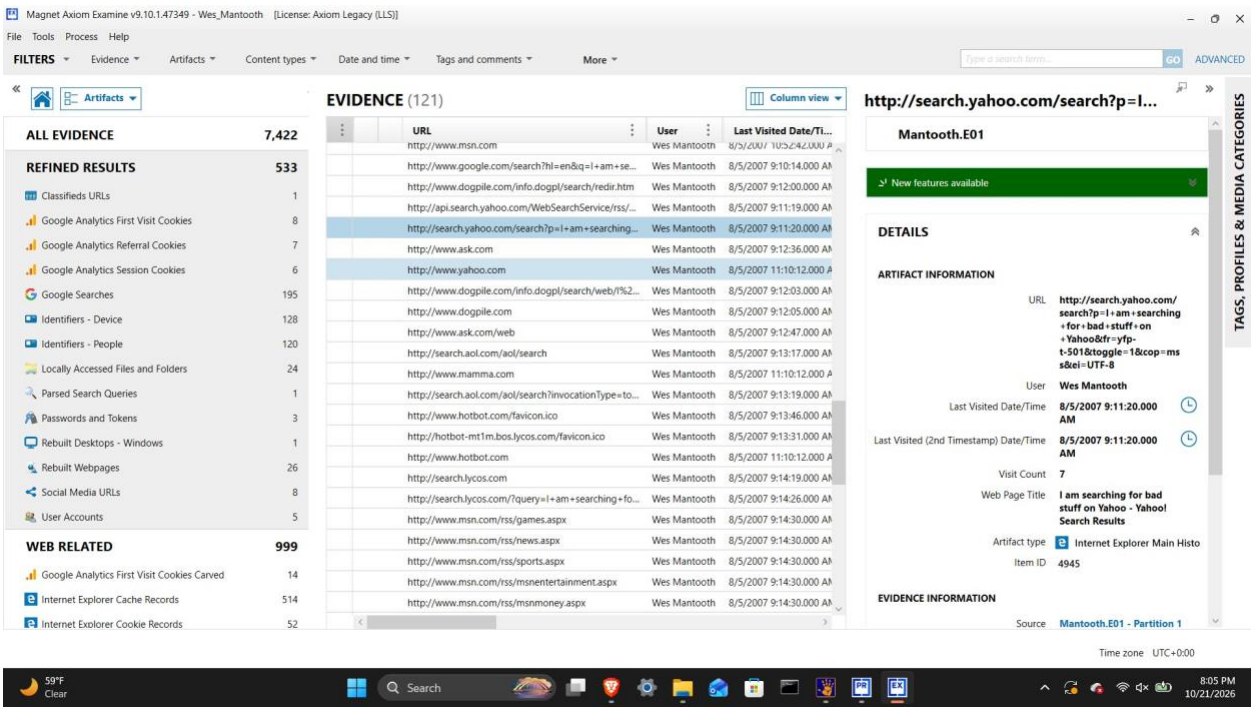

Figure 2.9

Rebuilt webpages.

AXIOM can rebuild webpages from the cache so I can see what the page looked like.

Three of the 26 rebuilt webpages are about making meth. Figure 3.0 is neonjoint.com “How to make meth,” visited at 11:15:52 PM. Figure 3.1 is totse.com “How To Manufacture Meth,” visited at 11:16:03 PM. Figure 3.2 is physorg.com “DEA demonstrates how to make meth,” visited at 11:16:19 PM. These show that he did not only search for it, he also opened pages about how it is made.

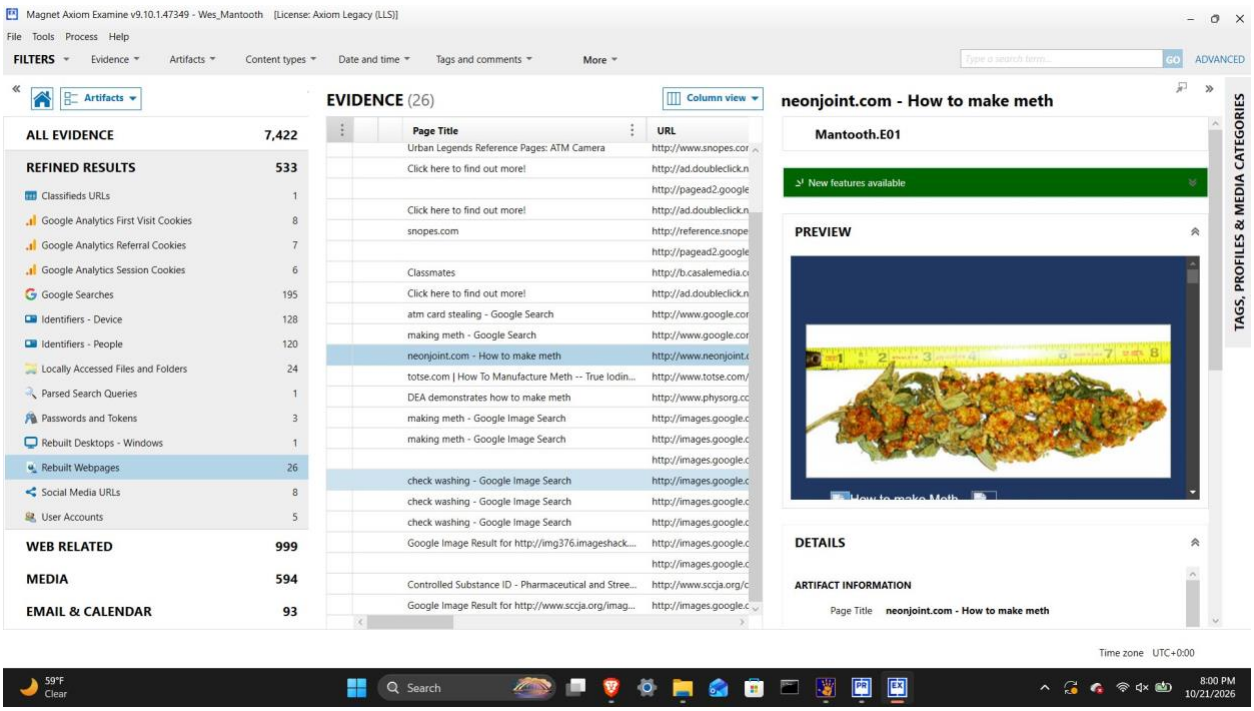

Figure 3.0

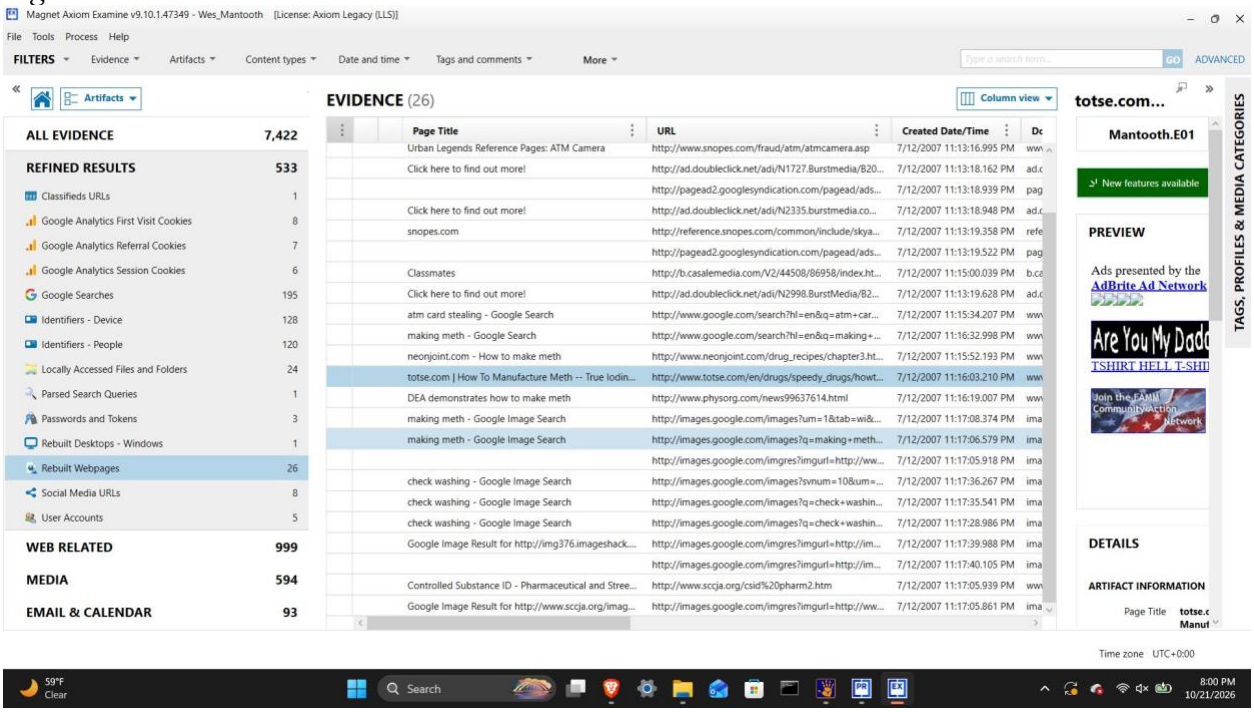

Figure 3.1

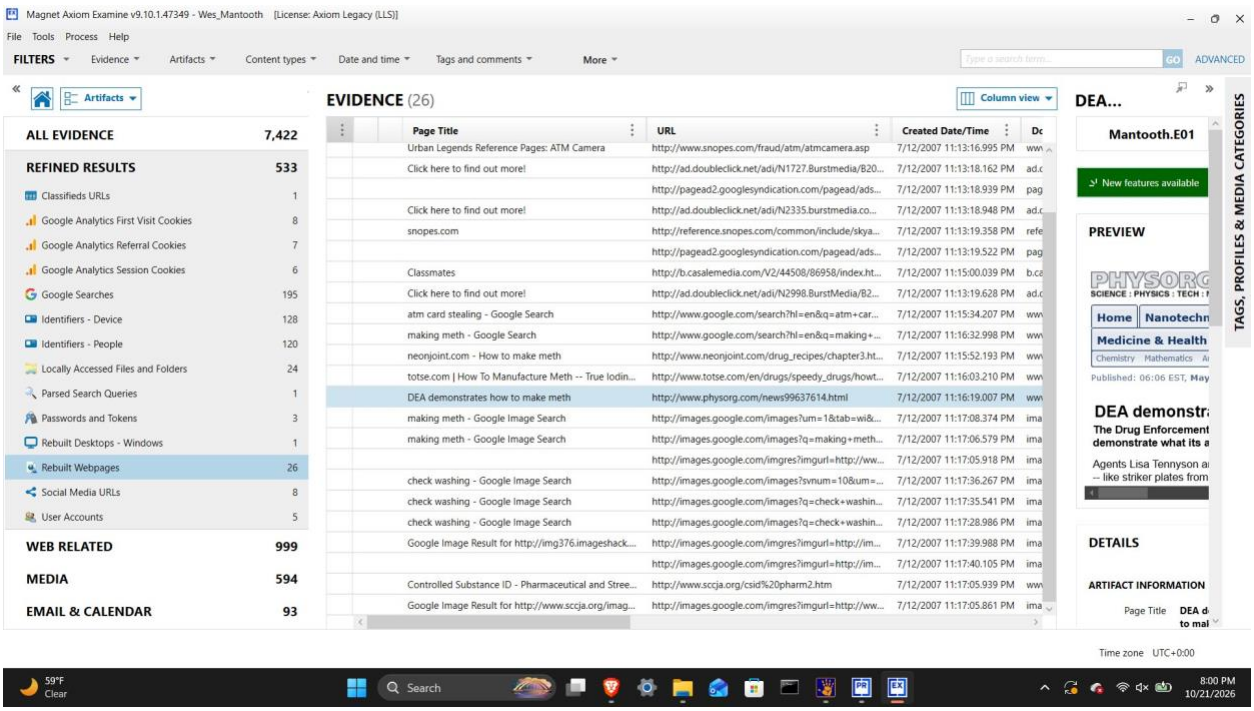

Figure 3.2

Media.

In the media categorization view AXIOM found 546 pictures and 2 videos. Not all of them are relevant to this case. The pictures I found that relate to the web history are grouped below by what they show. The item number is the number that AXIOM gave each picture.

Vehicle title and checks.

Figure 3.3 is a scan that looks like a State of New Jersey Division of Motor Vehicles title. Figure 3.4 and Figure 3.5 are blank check templates with placeholder names, like “Your Business Name Here” and “City Consultants, Inc.,” which could be used to print checks. Figure 3.6 is the file Check1.png, a check from SJI Entertainment made out for $1,950.50 to Computer Superstore, created on 3/6/2007 at 1:52:34 AM. Figure 3.7 and Figure 3.8 are check templates for “Tracy Smith” and “Dana Michaels” with placeholder bank names. Figure 3.9 is the file scan1.jpg, a scanned cashier’s check for $8,000.00 from the State Bank of Kimball with the remitter Stephen Smith and the payee Chris Moon. It was created one second after Check1.png

(3/6/2007 1:52:35 AM) and last accessed on 7/13/2007 at 6:44:38 PM. Two check images created one second apart tells me they were saved or scanned together.

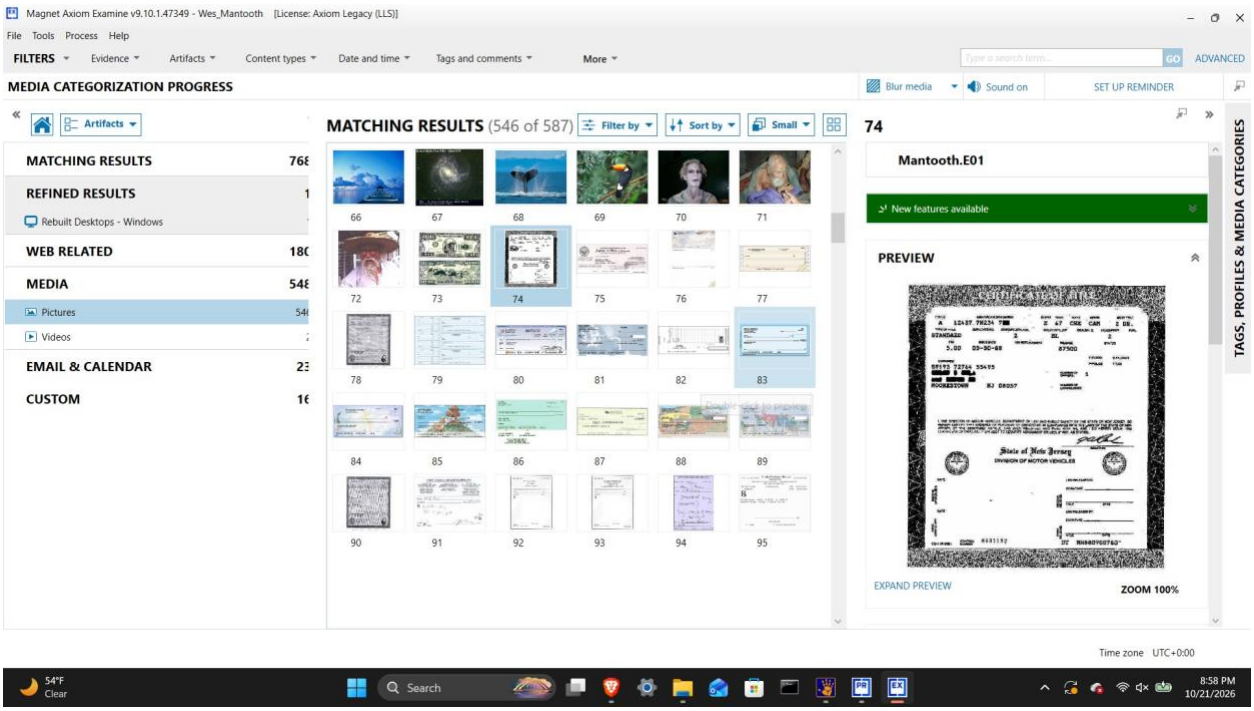

Figure 3.3 – Vehicle title

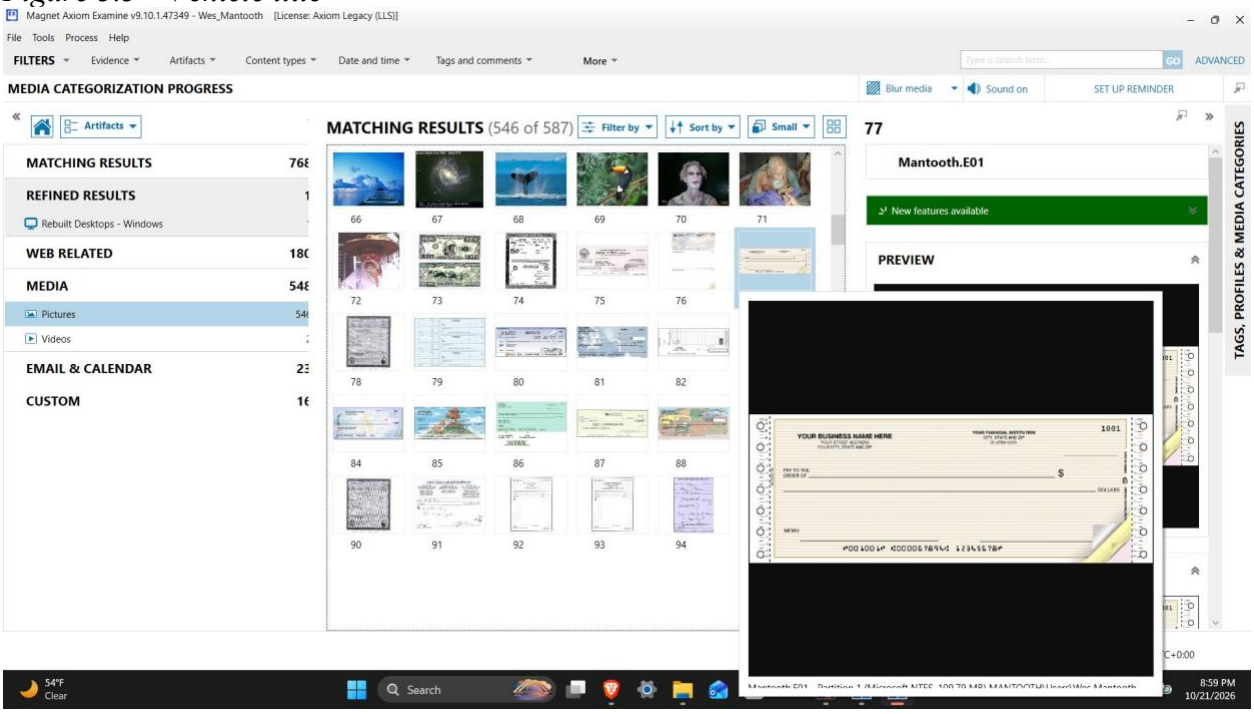

Figure 3.4 – Blank check template

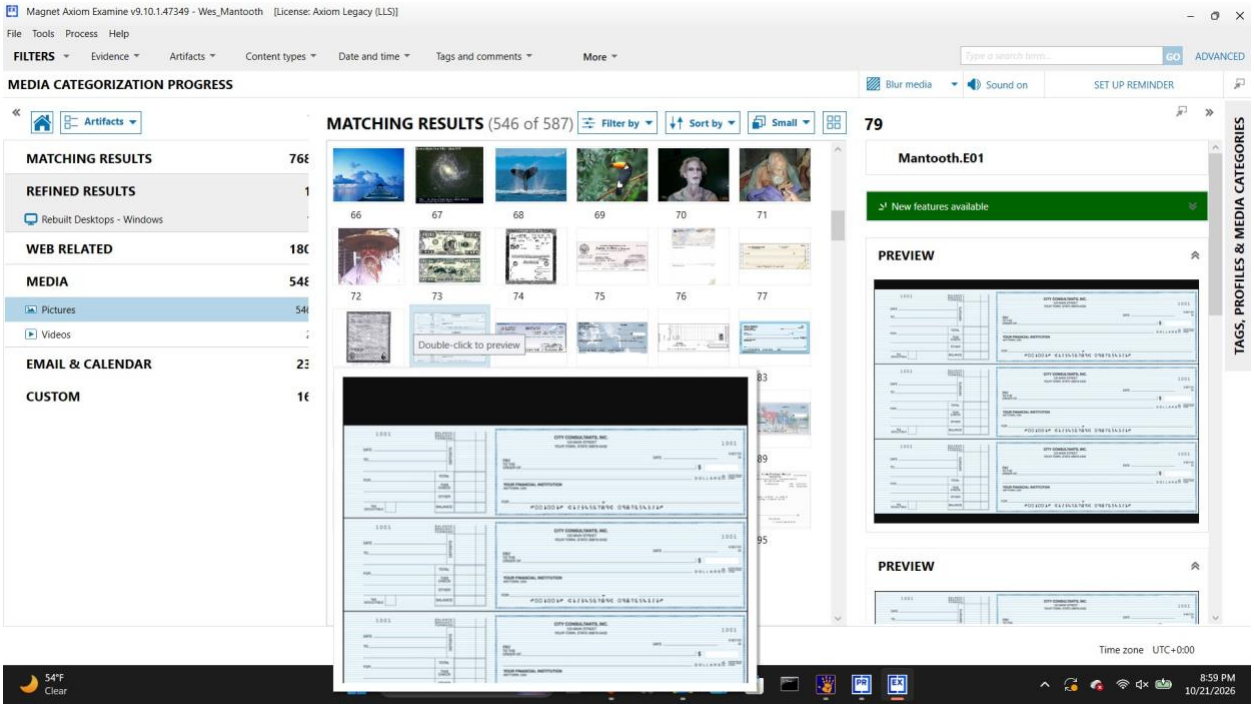

Figure 3.5 – Blank check template

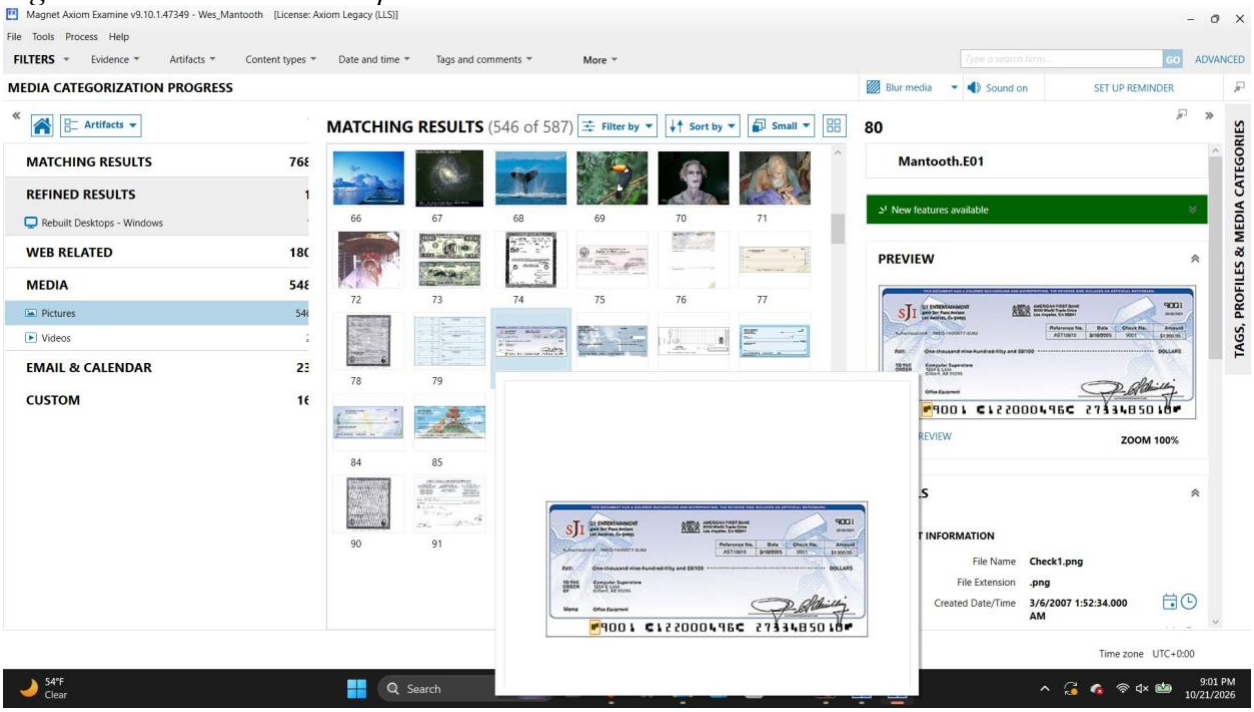

Figure 3.6 – Check1.png

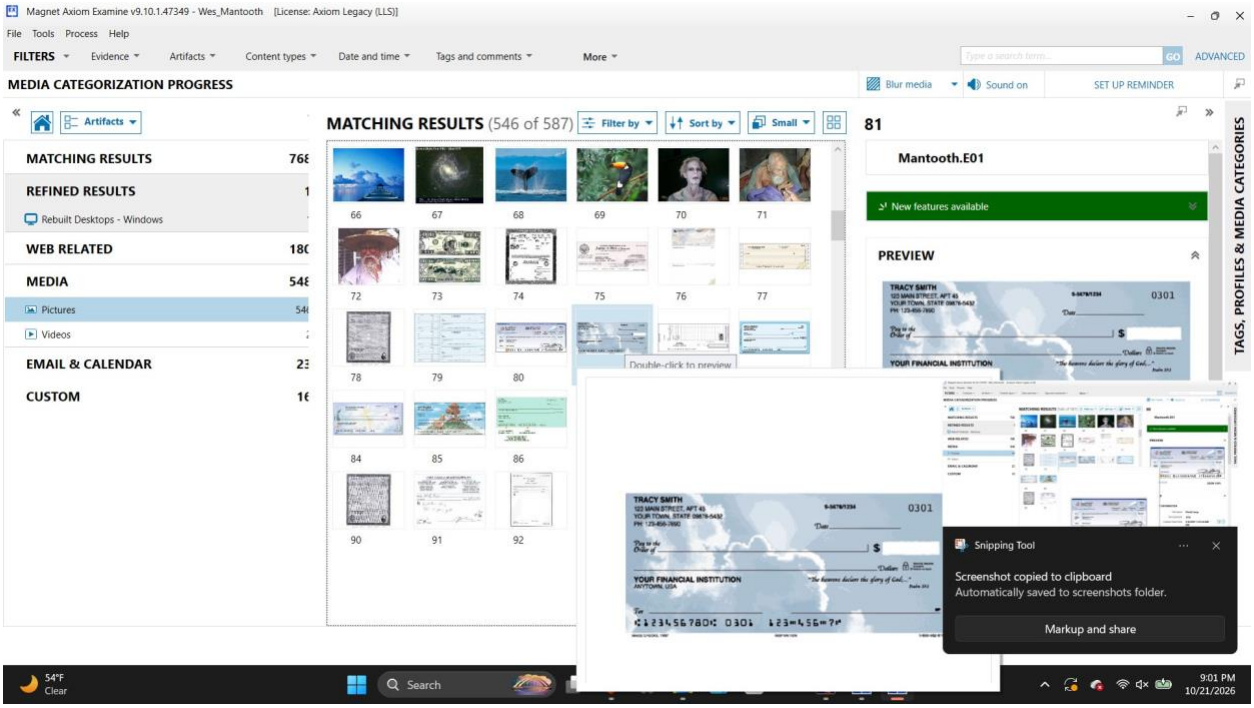

Figure 3.7 – Check template "Tracy Smith"

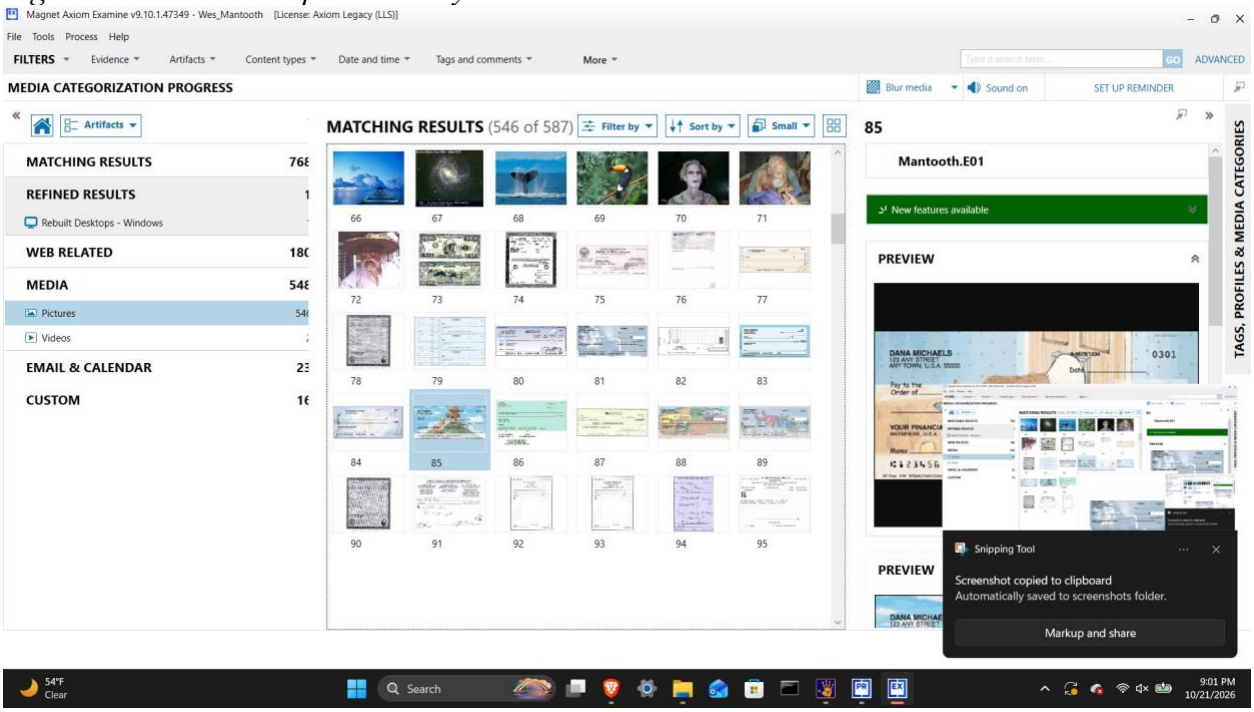

Figure 3.8 – Check template "Dana Michaels"

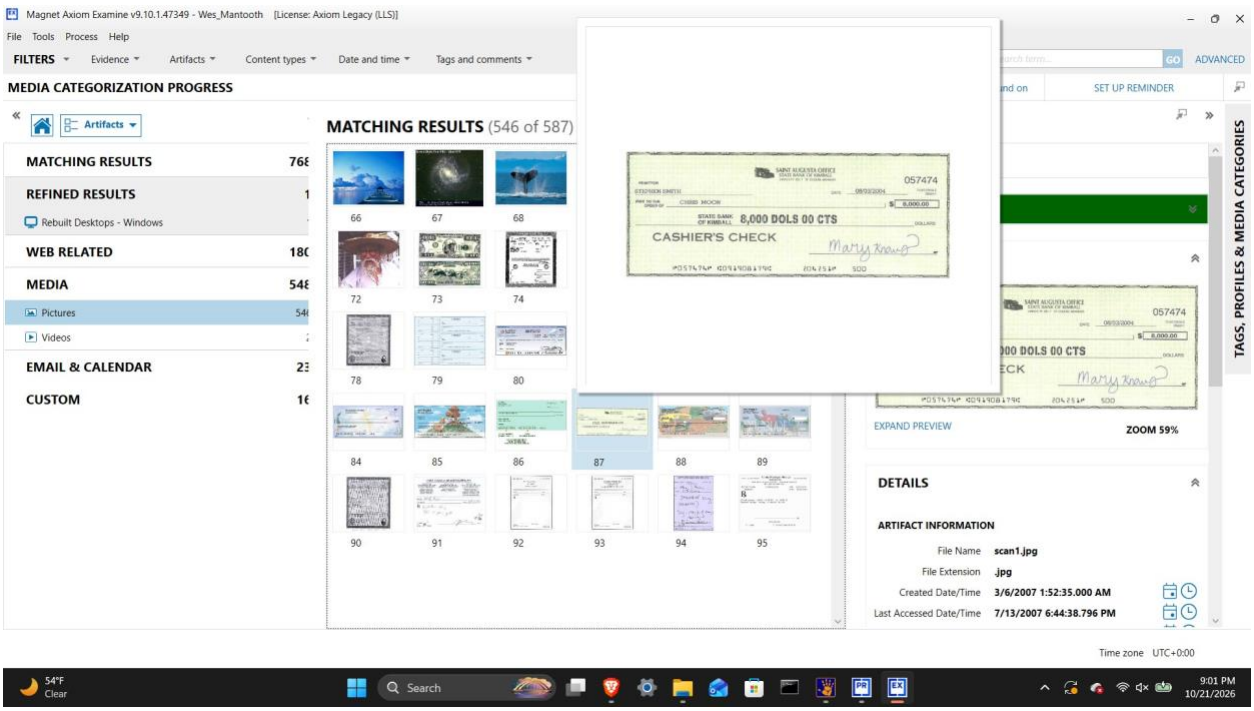

Figure 3.9 – Cashier's check (scan1.jpg)

Prescription.

Figure 4.0 is a file named Prescription2.gif that was saved in Users\Wes Mantooth\Documents\Scripts. It is a prescription form from "Family Physician Medical Group Inc." for the patient "Thomas Book" dated 03/22/2004, with the generic doctor name "John Doe MD." The medications listed are Advair and Tagamet, which are not controlled substances. Even so, the generic doctor name, the folder named Scripts, and the other prescription files in the Recent Docs (prescription.gif and doc-prescription.jpg) tell me this is a prescription template that could be used to make a fake prescription.

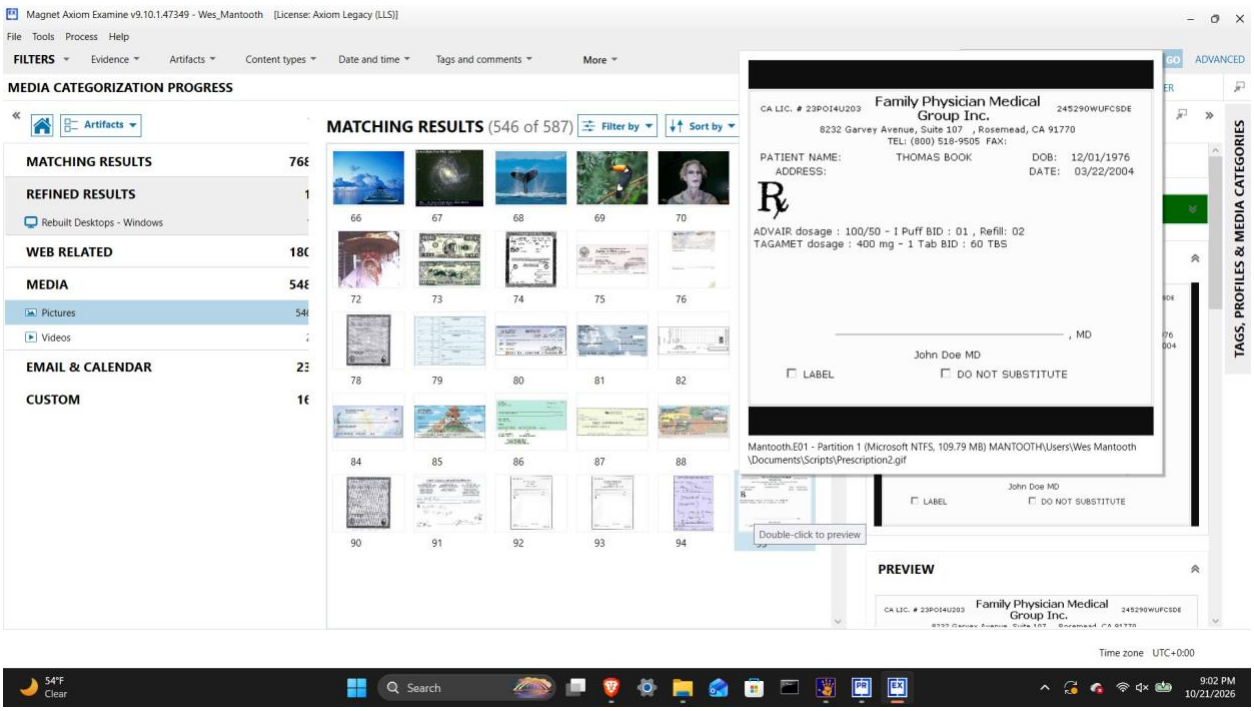

Figure 4.0 – Prescription form (Prescription2.gif)

ATM images.

Figure 4.1 and Figure 4.2 are photos of an ATM with a brochure holder next to the screen. This is the same setup that the Snopes ATM camera pages talk about, where a camera is hidden to record people typing their PIN. Figure 4.3 is a grainy black and white image of a man with a “CAM 2” label that looks like a surveillance camera frame. It was cached in Temporary Internet Files and created on 7/12/2007 at 11:15:24 PM, which is ten seconds before the “atm card stealing” web search.

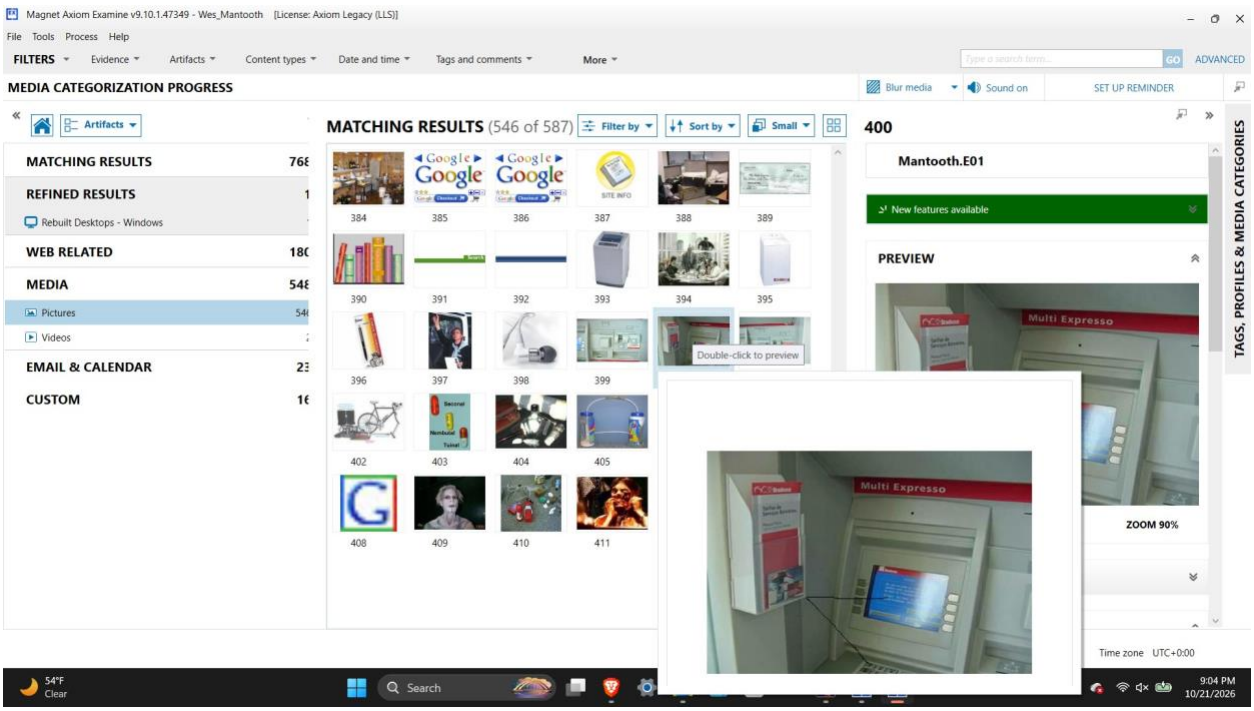

Figure 4.1 – ATM

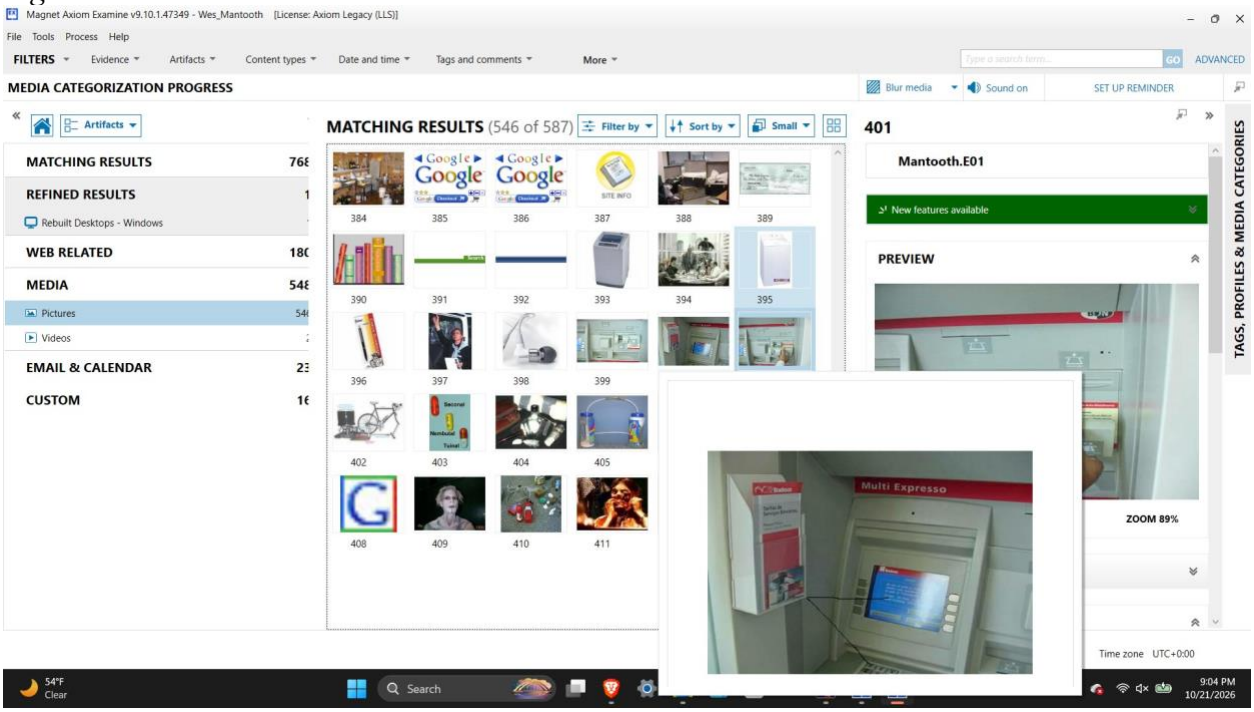

Figure 4.2 – ATM with a hand on the machine

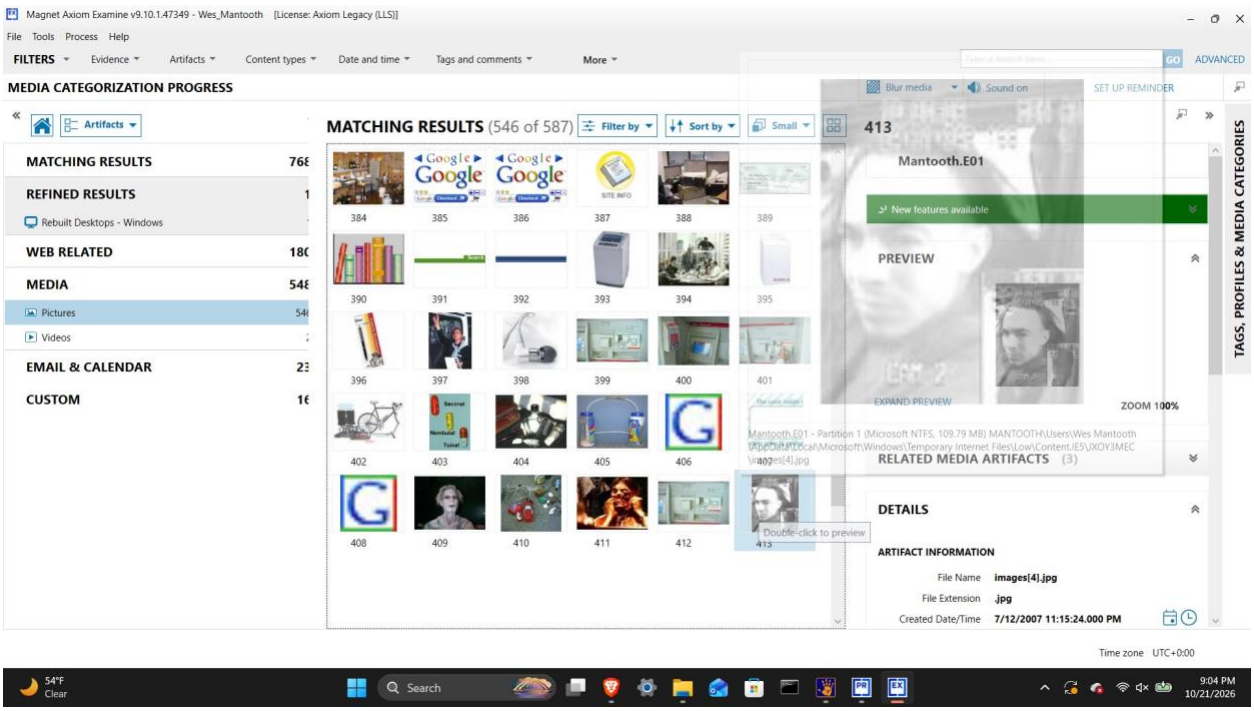

Figure 4.3 – Camera image

Drug related images.

Figure 4.4 is the file images[9].jpg, a photo of bottles, containers, and supplies on a table that are numbered 1 through 14. It was created on 7/12/2007 at 11:16:44 PM, right after the "making meth" searches. Figure 4.5 shows two cached images. Item 403 is a picture of Seconal, Nembutal, and Tuinal capsules (barbiturates) and item 404 is csid_cocainepara_small[1].jpg, a cocaine paraphernalia picture. Item 404 was created on 7/12/2007 at 11:17:06 PM, the same minute as the "making meth" image search.

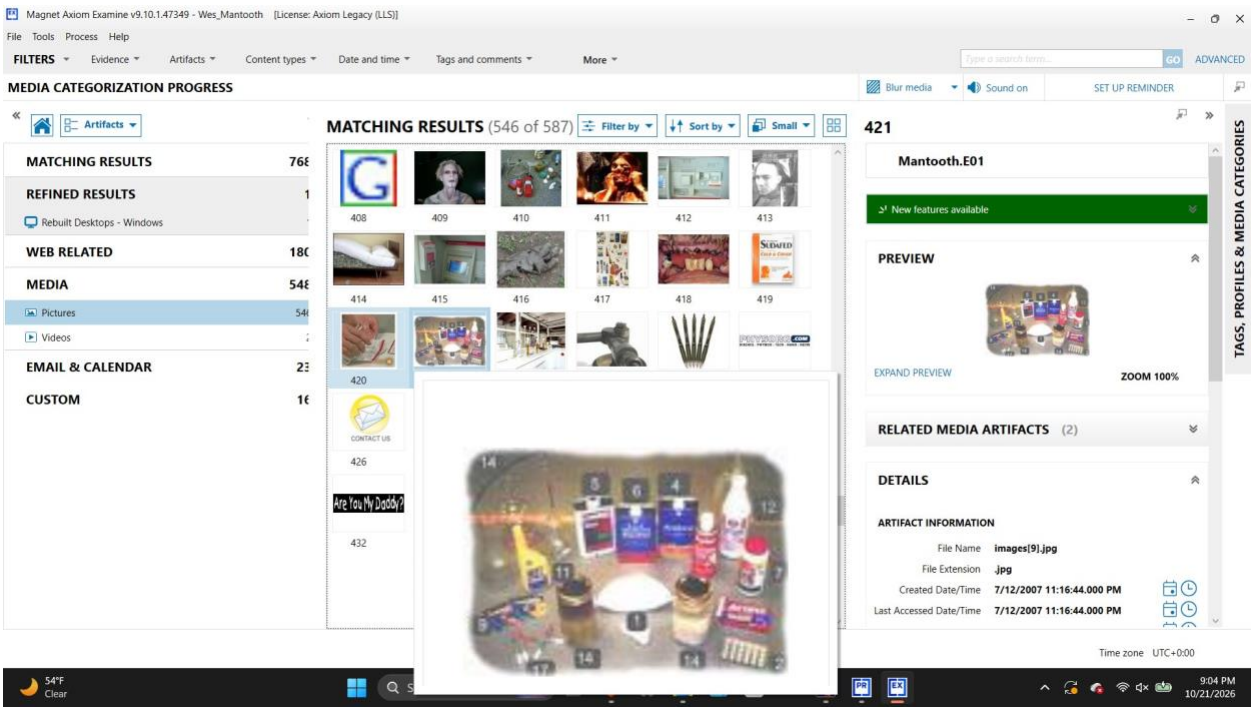

Figure 4.4 – Numbered supplies photo

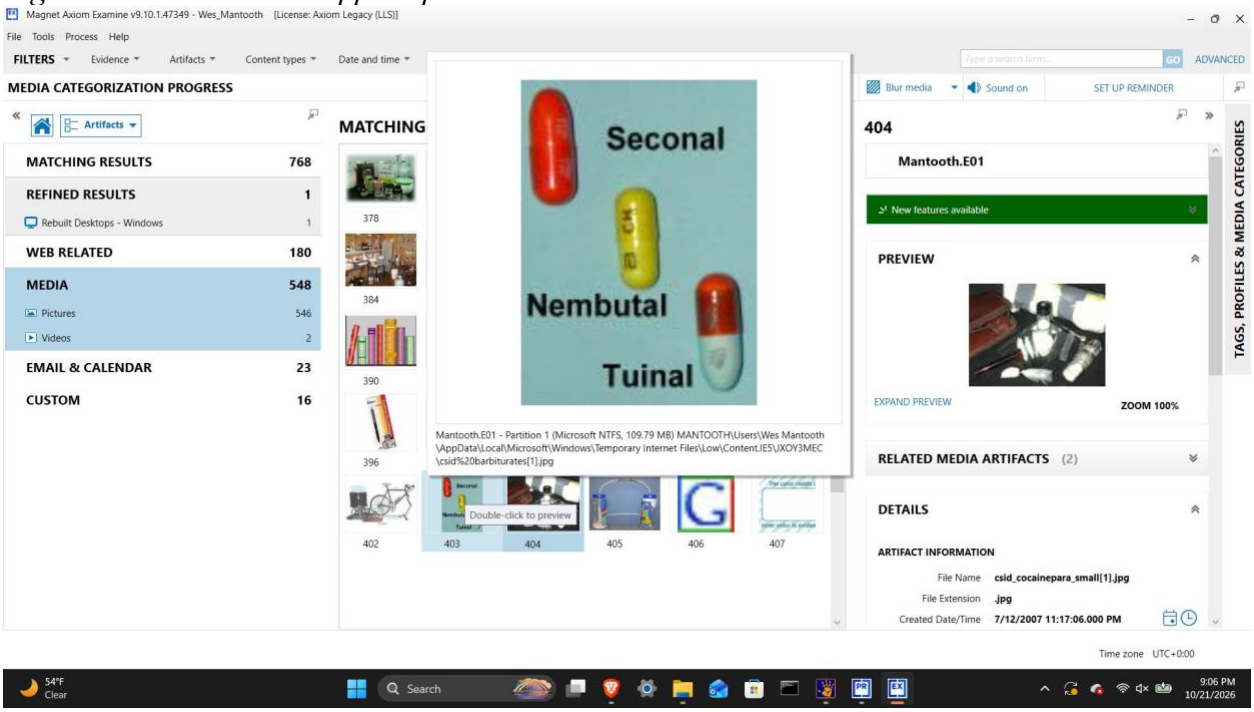

Figure 4.5 – Barbiturate and cocaine paraphernalia images

Email attachments.

AXIOM found 23 email attachments. Several of them are the same kind of pictures I found in the media section. Items 7 and 8 look like prescription forms, items 17, 18, and 21 show an ATM, and items 16 and 20 show an opened device with a Panasonic battery and wiring.

Figure 4.6 shows item 16. Since these pictures were attached to emails, they may have been sent to or from someone else.

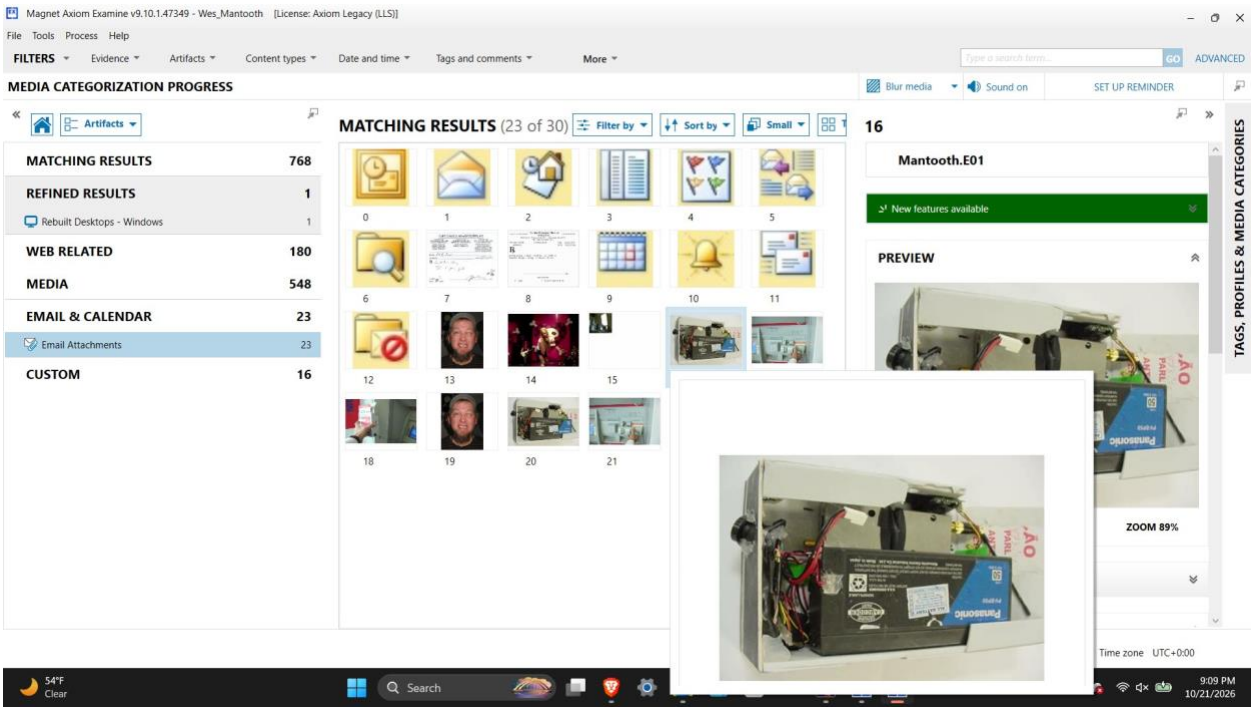

Figure 4.6 – Device with a battery (email attachment)

Documents.

AXIOM found 84 documents: 2 Excel files, 12 Word documents, 1 PDF, 2 RTF documents, and 67 text documents.

Text documents.

Most of the text documents are Internet Explorer cookie files for the user, such as wes_mantooth@www.evidence-washer[1].txt (4/10/2007) and wes_mantooth@www.truecrypt[1].txt (4/11/2007). These tell me he visited a website for Evidence Washer and for TrueCrypt, which are an anti-forensic program and an encryption program. Two text files stand out. Figure 4.7 shows My Confession.txt, a 232 byte file modified on 8/14/2007 at 9:26:41 PM. In it he writes that he robs from the rich and the poor, that he did it all and is guilty, and that he is deleting the file so it will never be found. The file does not say what he did and it ends with a smiley face, so I have to be careful about how much weight I give

it. Figure 4.8 shows How to Steal Cars.txt, a 4,956 byte file modified on 8/15/2007 at 6:10:46 AM. It is a copy of an article called “Top 10 Ways to Steal a Car (and how to defend against them).”

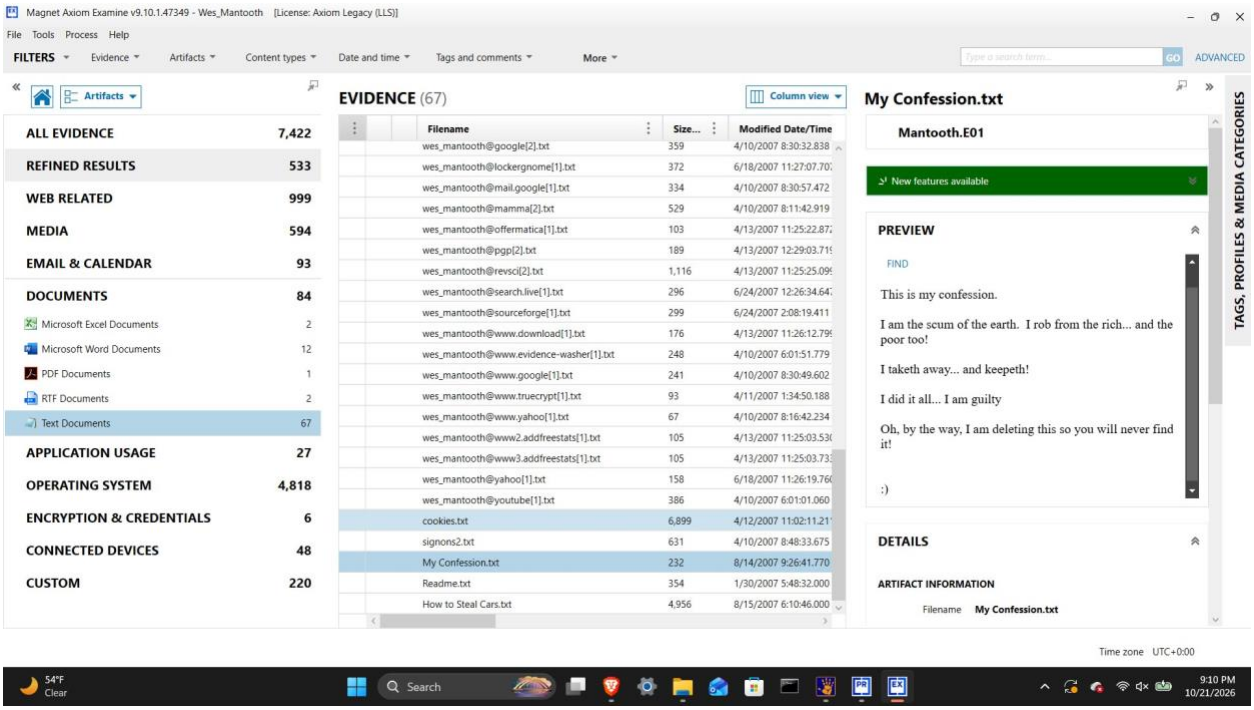

Figure 4.7 – My Confession.txt

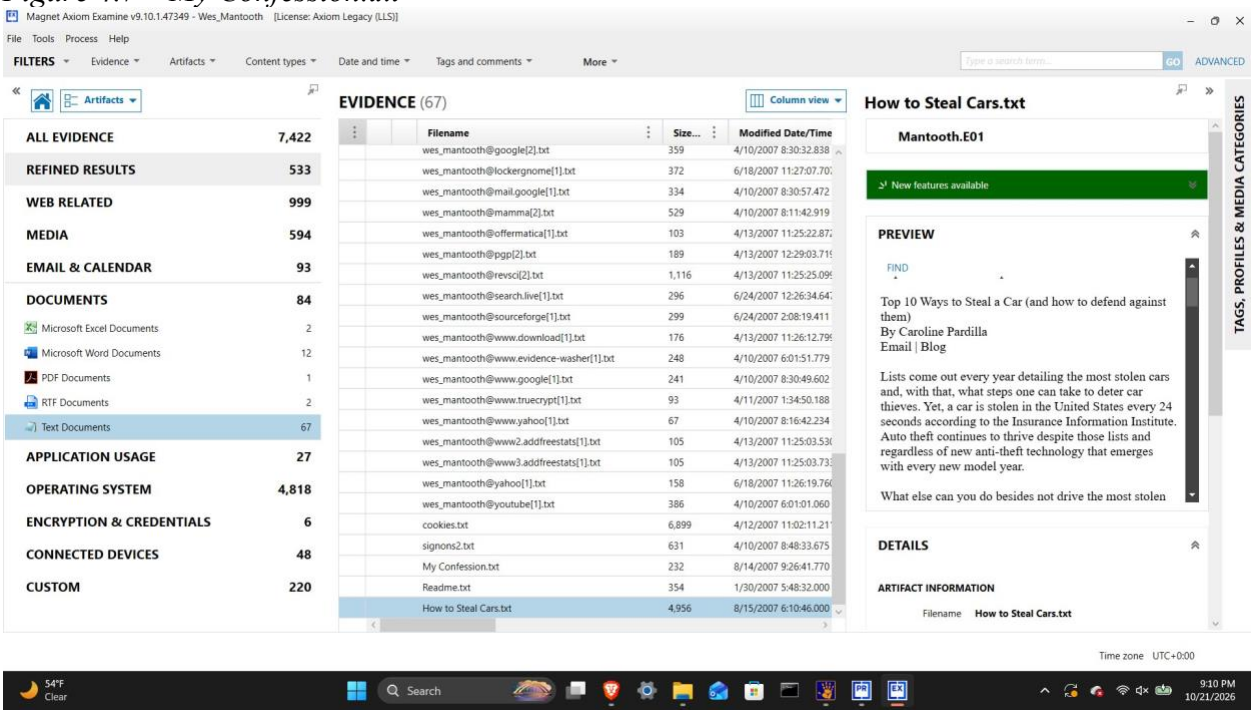

Figure 4.8 – How to Steal Cars.txt

Conclusion

Our suspect is Wes Mantooth and the computer owner information also belongs to Wes Mantooth of Volturi Enterprises. The computer name is WESMANTOOTH-PC, which is based on his name, and the operating system was installed on 2/27/2007. Out of the five accounts on the computer, his has 96 logins. The Dracula account stopped logging in on 04/02/2007, before the activity I found, and the Laurent account was never used, so the evidence points to Wes Mantooth as the person using this computer. All of the times in this report are in UTC.

In the web history, on 7/12/2007 between 11:13 PM and 11:17 PM, he visited Snopes pages about an ATM camera and then searched Google for "atm card stealing," "making meth," and "check washing." He also opened three pages on how to make meth (neonjoint.com, totse.com, and physorg.com). On 8/5/2007 he searched for "I am searching for bad stuff" on Google, Yahoo, and other search engines.

The pictures match the fraud searches. I found photos of an ATM with a brochure holder, a surveillance style camera image, and an opened device with a battery that was also sent as an email attachment. I also found blank check templates, check images, a scanned $8,000 cashier's check, and a scan of a state vehicle title. The Recent Docs list shows he opened files named ATM_THEFTS1.ppt, CC Nums.xls, Those who owes.xls, and C money plates.doc and folders named Checks and Car Titles. The ones opened from drive E: or F: are on removable media, so I cannot confirm what is in them. Together this supports the allegation of credit card skimming fraud and also check fraud.

For the drug allegation, he searched for how to make meth, opened three pages with instructions, and cached images that included barbiturates and cocaine paraphernalia. A numbered photo of supplies was created in the middle of those searches. The prescription template in the Scripts folder and the other prescription files in the Recent Docs also tie into this.

I did not find pictures of a lab or of finished drugs, so what I found supports that he was researching and attempting to make drugs, not that he actually made or had them.

The computer also has BestCrypt and TrueCrypt installed, a BESTCRYPT prefetch file, BitLocker key text files in the Recent Docs, and a cookie from the Evidence Washer website. I was not able to open any encrypted containers, so there could be more evidence that I could not see. He also had forensic tools such as FTK Imager and Registry Viewer installed. In the text documents, My Confession.txt says he is guilty but does not say of what, so I would not rely on it alone. How to Steal Cars.txt is an article about stealing cars and defending against it, and it only fits with the vehicle title picture and the Car Titles folder if there is more to support it.

Overall, the evidence supports that Wes Mantooth used this computer to research and plan credit card skimming and check fraud and to research how to make methamphetamine. The strongest evidence is the timing. The searches, web pages, and pictures all happened within a few minutes of each other under his own user profile. This image alone cannot prove that he carried out the fraud or made drugs, so I would recommend examining the removable devices listed in the registry.

Appendix of Terms

ATM skimming – Using a hidden device or camera on an ATM to steal card numbers and PINs.

Carving – Recovering files or records from raw data without using the file system.

Check washing – A type of fraud where the ink on a check is removed so it can be written again.

E01 – The Encase evidence file format used for forensic disk images.

Hash File – A digital finger print of each file.

HIVE – It is a group of keys and subkeys that have values that support your computer. Only found with Windows operating systems.

Imaging a drive – Capturing a bit-by-bit copy of the original contents.

Mail Client – A program that is used to host your email. Ex. Outlook Express, Outlook.

MD5 – An algorithm that creates a hash value for a file or an image.

NTFS – New Technology File System, it is the file system that is responsible for storing and retrieving files.

Operating System – The software that handles the process and memory on your computer. There are three base systems. MacOS, Windows, Linux.

Registry – Where all the configuration settings are stored.

SAM – Security Accounts Manager, the registry hive that stores user account information.

URL – Uniform Resource Locator, it is a web address that can be inputted or clicked on.

USB – Universal Serial BUS, a newer type of serial connection that many devices can use.

UTC – Coordinated Universal Time, the time standard that the timestamps in this report use.
